California State Library

EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

CA LIBRARY

MINING AND SCIENTIFIC PRESS.

Subscription, $3 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JANUARY 2, 1869.

VOLUME XVIII. Number 1.

Table of Contents.

Turbine Water Wheel—Illus
The Freiligh Mines in N. Y.
The Magnetic Sand Separating Machine.
White Pine Silver Ore Deposits
Mining in Placer County.
To Silver Coat Cotton Fibrous Material
White Sage.
Cod Liver Oil.
Iron by Electricity.
Dumesnil's Wine Process
Sea Weeds for Medical Purposes.
Soap Growing on Trees.
Enterprises and Developments.
Changes in Hydraulic Mining
Improved Method of Working Roasted Gold and Silver Ores.
Geological Survey Map.
MECHANICAL MISCELLANY.—Heaton's Process; The "set" of Twisted Wheels; Theory of Puddling; Bolts and Nuts; Bridge Across the Channel.
SCIENTIFIC MISCELLANY.—Occlusion of Hydrogen of Metals; Sepsine; Lyctine; Decomposition of Oil of Turpentine; Fossil Horse in Nebraska; Alcohol a Food.
MINING SUMMARY—Comprising late intelligence from the various counties and districts in California, Dacotah, Idaho, Montana, Nevada and New Mexico.
Railroad Opening Excursion.
The Overland Monthly.
Exclusiveness Among Scientists.
Sulphur Treatment of Wine.
Quarrying with the aid of Frost
French Leather.
Mechanical Taste
San Francisco Mining Shareholders' Directory.
New York Metal Market.
San Francisco Metal Market.
San Francisco Market Rates.
Notices to Correspondents.
Stock Prices—Bid and Asked.
New Incorporations.

The Turbine Water Wheel in the Foot-Hills.

THE BODINE JONVAL TURBINE.

Economical power, in a land whose capabilities are so vast and suggestive ae those of California, in connection with our steadily developing manufactnres and incrcasing commerce—not to mention its particular relation to the present leading intereste of the foot-hills, which are serving to plant others that will be more permanent—becomes a question of an attractive character in a general way. Like the rich valleys which were but recently passed by as worthless, now blooming like the rose, so *power*, and the conditions attending its favorable application to supplying the world'e dcmands, is undervalued, or overlooked; it is passed by without the bestowal of a thonght upon the matter, because we do not realize sufficiently that conditions, snch as the cost and facility of transportation, the price of labor, and the extent of the goverving commercial demands, are chauging materially, and not by any means slowly, under our eyes.

Mining in the foot-hills will never fall oft snddenly; it ie evident that eveu deep placer mining mnst last profitably for centuries. In view of the sitnation of California, of the Pacific world, and of our incomparable advantages of climate and water-power and the delightful natural surronndings presented by the foot-hills for nestling thriving mannfactnring villages and comfortable popnlations, where every laborer shall literally rejoice under his own thrilty vine and fig tree, and where the skies are as pnre and bright as those of Italy, it eeems strange and unaccountablo, thongh fact it is, that rich lands, and picturesque oak-glades, reminding of English parks, in the vicinity of green valley nooks having abundant streams, should remain lying worthless, or be held to-day at only a few dollars an acre, within twelve hours travel of San Francisco.

Steam aud cheap coal ncar tide water, may offer greater indncements at preseut for the location of a limited number of mannfactnring enterprises whilc transportation is an item against the foot-hills; bnt the future, whether far or ncar, is defiuitely foreshadowed.

With the turbine water wheel the preliminaries to obtaiu power cost little or nothing; several hnndred dollars is all the capital that is required to furnish that which will set any kind of machinery in motion. A wheel 3¼ inches in diameter,—that may bo carried in the pocket,—with 100 feet head, will give one-horse power; one of five or six inches diameter will give eight to ten-horse power; a 9 inch turbine, with sixty inches of water and 100 fcet head, will give 16-horse power at 38 revolutions a minnte. The cost of a turbine that will run a 20-stamp mill, (abont 23-horse power,) with 62 feet of water is $250, and of the pipe for the same, from $1.50 to $3. To inaugurate wooden ware, turniug, or fnrnitnre factories, a small outlay, with favorable transportation to market, wonld be the only nccessary conditions.

Respectable honses and generous home comforts are still too rarely found in California, yct there are great improvements being made. Hundreds of little articles of use and ornament,—carpets, and other textile wooden and iron fabrics, snch as machincry and local production can present cheaply, are already employing a considerable proportion of the laboring popnlation of the State, thongh hitherto confined for obvions reasons, mainly to the vicinity of San Francisco

To give an idea of the simplicity of the turbine, and its adaptation to small qnantities with a great fall of water, the two accompanying illustrations, being perspective and sectional views of Bodine'e Jonval turbine, will serve onr purpose. The turbine is fitted into a tnbe, box or "penstock," where the water, in paeeing forcibly

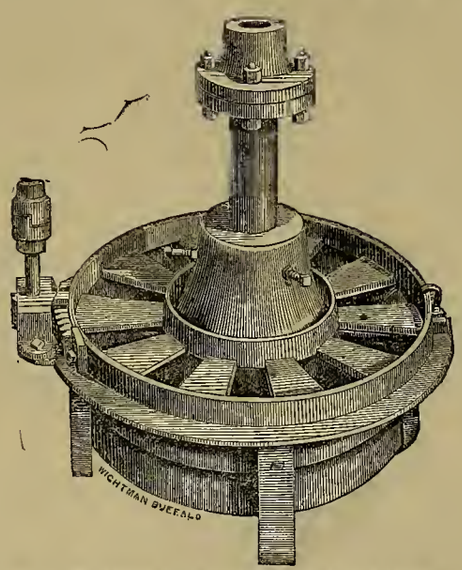

Fig 1—PER PECTIVE VIEW OF THE BODINE WATER WHEEL.

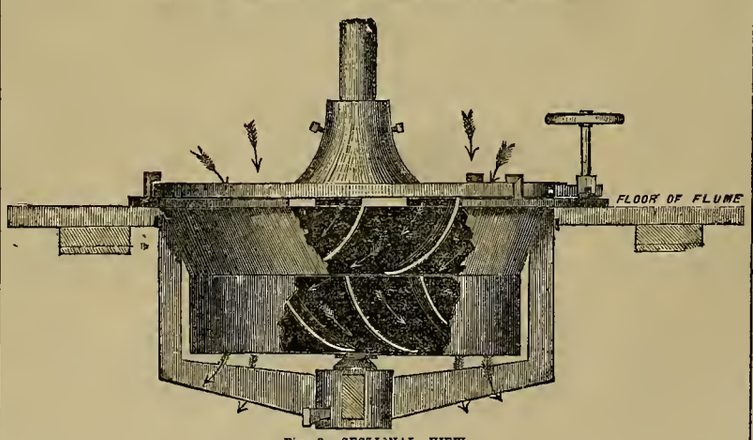

Fig. 2.—SECTIONAL VIEW.

down mnst pass through it, in a manner precisely the reverse of the steamer propeller—the water moving the propeller, instead of the latter moving against the water. Fig. 1 exhibits the appearance of the complete instrument, as looked at from the ont-side; fig. 2 shows the relations of the upper and stationary part to the lower and moviug half; the white lines represeuting the buckets, or shovels, to which the flow of water has to accommodate itself, and the arrows showing the direction taken by the water, which forces the lower half and its connected axle, to turn.

Regarding the different kinds of water wheels and water engines in use- the over-shot, the under-shot, the breast halfway-between these, and the turbine, are the common ones; all of which are modified by a great variety of shapes as to the shovels or buckets used; in which the primitive principle, however, remains the same. Amongst the turbines that of Fourneyron, the inventor, was the earliest, but it has been superceded by numerous others.

The Bodiue Jonval wheel, here represented, is manufactured in Westfield, Massachusetts, by the Bodine Company, a new association. With some of the gentlemen composing the compauy, we are persoually aeqnainted. They are represented on this coast by Messrs. Fuller & Co., No. 109 Montgomery street, who are just introdncing the wheels into this field.

The proprietors make the following claims for their wheel:

That for all positions aud under any head of water, it ie better adapted to drive machinery than any other kind of wheel in nse.

As the water enters in a direct line of the wheel's rotation, we avoid the lateral presenre and friction against the cnrb, to which other wheels are snbject, hence it will give out a greater amonnt of power with the same qnantity of water, than any other wheel ever inventcd.

It has the advantage of using every inch of the head or fall of the water, and is not effected by frost in any way.

The water can be ehnt off at any time, and the wheel left dry for repairs or for the removal of accidental obstructions.

Our wheel is so constructed that the head and fall of the water produces no weight npon the step; the tendency of the water is to raise the wheel which prevents the step from wearing, and overcomes much friction to which other turbines are snbjected. Our steps and followers are made of lignnmvitæ. Wo had wheels rnnning under high heads, for nearly two years, in which the step has not run down a particle. If after long usage the step shonld wear down, it is but the work of a momen' to raise it to its original position.

The wheel is cast in one piece, by a new process peculiarly designed for the purpose, making it a strong, smooth and perfectly balanced wheel.

They are made in the most snbetantial manner, of iron or brass; greater weight of metal is used than is customary with other builders, consequently greater strength and dnrability is obtained.

The wheel is held to its proper place at all times, by a bridge trec above and below, secured firmly to the case of the wheel.

We have a new adjnstablo step upon which the wheel rests, by which the hight of the wheel is regulated to the case, so there will be no loss of water by leakage.

In our next number we shall continue the subject of turbine and water wheels, speaking more particularly of other wheels in use.

WHITE PINE.—Edward B. Dorsey, M.E., who has just returned from White Pino, reports that a careful examination of the ore deposits there, convinces him fully of their closo similarity in character to the mines with which he was formerly connected at Chañarcillo, Chili; except that the several veins which he has been able to recognize as such, are contact veins, and that they contain a good deal of quartz in the gangue.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Freligh Milbank Mines, Dutchess County, N. Y.

Editors Press:—I visited, Dec. 1st, in company with a party of scientific and practical quartz operators, the Freligh Milbank mines.

These mines are situated on the Murtch Farm, in the township of Rhinebeck, Dutchess County, N. Y., between three and four miles easterly from the village of Rhinebeck, and about six miles from Rhinecliff railroad station, on the Hudson River. The region is hilly, or mountainous, and in line with the Appalachian range, to which it evidently belongs.

These mines, thus far developed, consisting of four nearly or quite parallel lodes, I traced by their outcrops something over a mile, and I am informed by Dr. Edwin G. Freligh, their discoverer, Dr. J. G. Pohle, geologist and chemist, and Col. J. C. Lane, mining engineer and geologist, that they have traced them a distance of over forty miles, and that thus far they maintain their parallelism and distinctive features respectively.

On one of these veins, the Hudson, an opening sixteen feet long, wide as the vein, and twenty feet deep, has been made. The strike is N. 25° E., dip about 60° E., thickness, at right angles to the dip, fourteen feet ten inches. The veinstone consists of cellular quartz alternating with thin layers of slate rich in iron pyrites.

The quartz, unlike the "*boulder formation*" (so-called on the Pacific Coast), is fine and delicate in its crystalline structure, much resembling that of the better portion the Oneida, Eureka, Keystone, and Spring Hill quartz veins of California. The cavities in the quartz of the Hudson lode are, for the most part, filled with the oxide of iron, the result of the decomposition of the sulphides of iron. The salvage or "gonge" between the lode and "foot-wall," is distinct and regular, and about an inch thick. The wall rock on both sides of the vein is a talco-argillaceous slate. The surface of the earth for at least a mile and a half along the descent from the mine toward the river, is of a reddish-brown color, and is strewn with float or fragmentary quartz, varying in size from the grain to that of a foot in diameter.

The survey shows a point at the opening to be seven hundred feet above the river. Dr. O. P. Southwell, of California, and myself broke off about thirty pounds of the rock near the bottom of the opening and three feet from the foot-wall. We gathered about a pound of the decomposed material underlying this rock, which was hastily washed in a prospecting horn by Mr. J. A. Sperry, a thorough, practical miner. The result was highly satisfactory, showing many particles of gold visible to the naked eye. A small piece of rock taken from another place in the opening, was pulverized and washed, and several minute particles of gold obtained. I was shown the certificates of Messrs. Secor, Swan & Co., and other competent and responsible metallurgists, who had worked several tons of the rock from this lode. The lowest yield by amalgamation was $11.38 per ton—the average upwards of $20 per ton. Assays by the same parties, also by Dr. Torrey, of the U. S. Mint, present a still better showing. From the data obtained I can but conclude as follows, viz:

First—That the Hudson lode is a true fissure vein.

Second—That the rock is in large quantities, and can be mined at a low cost.

Third—That it is a gold-bearing vein sufficiently rich in gold to be worked with profit.

Fourth—That the rock can be worked to advantage by amalgamation.

Fifth—That the water on the premises is convenient and abundant for steam, milling and amalgamation, on a large scale.

Sixth—That the grounds near the opening mentioned are favorable as to elevation and declivity for quartz mill purposes.

Such, I understand and believe, are the convictions of each one of the party who visited the mines with me.

Dr. Southwell, a man of sound judgment, scholarly attainments and great practical experience in all the departments of mining and treatment of ores, authorizes me to say that he fully indorses the conclusions to which I have come.

As to the other veins mentioned parallel with the Hudson lode, I will simply remark that their heavy outcrops indicate large lodes, and that wherever they have been broken the rock looks well, and, as I am advised by Dr. Pohle, contains gold.

As to the discovery of these mines, the facts are, substantially, that in 1859 Dr. E. G. Freligh the younger, then a medical student and a lover of geological science, much questioned the theory of the day, in reference to the non-existence of gold in this vicinity. He seized upon these facts: 1st. That the geological formation was similar to that of the Appalacian range north and south of the region in question. 2d. That the color of the soil indicated mineral deposits. 3d. That the "*float rock*" or fragmentary quartz strewn over the ground was significant of a "Mother Vein" in the vicinity.

Possessed of these data, he vigorously pushed his explorations until rewarded by the discovery of the vein, or rather system of gold-bearing veins, above described.

Saying nothing of the honor due Dr. Freligh, the discovery at least is a proud triumph of science, and one promising great wealth to the owners of the mines, and incalculable benefits to the country.

P. M. Randall.

New York, Dec. 3, 1868.

The Magnetic Sand-Separating Machine.

Messrs. Editors.—I have read in your paper of Dec. 12th, a description of the Metallurgical works of J. Mosheimer, of this city: Of his furnace for reducing magnetic iron sand; also an invention of a machine said to have been invented by Mr. Mosheimer, for separating the fine magnetic ore from the common sand. With due respect to your statement and proper defereuce to your informant, I will state that Mr. Mosheimer is not the inventor of this magnetic separator as described. I claim to be the inventor of that principle, and have in my possession a small model machine, made about five years ago. Many of my friends have witnessed the operation of my machine, and now insist upon my requesting this correction. I would state that about three years ago I had some connection with Mr. Mosheimer, and other gentlemen in constructing a furnace to reduce magnetic oxides. I furnished the plans and Mr. Mosheimer executed the work, and during this time and in presence of one of the gentlmen interested in the furnace, I explained to Mr. Mosheimer my principle and plan for separating the ores, the same as you have described in your paper. Since Mr Mosheimer's return from Europe, as the representative of the State of California to the World's Fair, his mind has been so occupied and time taken up in giving instructions upon the various modes of treating metals that probably he has forgotten the source of his information in relation to the Magnetic Separator. J. H. White.

San Francisco, Dec. 16, 1968.

Ventilation in the Depths.—The miners are obliged to put up with extreme heat and inefficient ventilation in some of the deep workings at Virginia City, notwithstanding the use of blowers to a limited extent. The *Safeguard* says: We understand that the employés in the Bullion incline have about concluded that they are extremely liable to bring out at any moment in a Chinese tea field. Heretofore, and all along until within the last day or two, the rock in the bottom of the incline has been dry and hot almost beyond endurance, but now water is exuding through small crevices at the bottom, and most wonderful of all, a current of air escapes at the same point, with sufficient force to blow out the workmen's candles if allowed to come in contact with it. The miners never think of going down the shaft now without being provided with all the latest maps of China; so that if they should strike through and bring up in the interior of the Celestial Kingdom they will be able to find their way back to the sea coast.

[Written for the Mining and Scientific Press.]

Nevada Silver Ore Deposits—White Pine.

Having recently visited the new district of White Pine, in southeastern Nevada, I am enabled to give you my opinion concerning that interesting country. The principal mines now attracting so much attention at home and abroad, are those located on what is known as Treasure Hill, and although I have made a critical examination of the country about this hill, for a distance of forty miles, I shall have no time at present to refer to anything but Treasure Hill.

The town of Treasure City, and the principal mines located on Treasure Hill, are elevated close to 9,000 feet above the sea-level, and the summit of the mountain rises gradually to the hight of nearly 2,000 feet above the level of the valley, which surrounds, and makes this almost an isolated peak, differing in some respects in formation and character from the adjacent mountain ranges; the surrounding country, and even the top of the mountain, bearing unmistakable evidence of having at no remote period been covered by water.

As far as I have been able to study it, the chief mountain formation belongs to group 2, it being a conglomeration of lime and calcspar filled with crystals of carbonate of lime and chalky argillaceous earth, carrying very large and irregularly defined veins, with extensive ore beds, evidently lying horizontally from the hanging to the foot-walls, resembling in many respects some of the principal mines of Chili and Peru.

The most noted mines at present opened, are the Eberhardt and Keystone Consolidated, the Hidden Treasure, Aurora, and Virginia, all opened to some extent, but especially the former, which is principally explored by two vertical shafts, one being down seventy-five feet near the foot-wall, and the other near the hanging wall, being down sixty-five feet. A 30-foot level has developed the vein from one main wall to the other, proving beyond a doubt, an almost continuous mass of extremely rich chloro-bromide of silver ore. The Eberhardt vein has a width between the main walls varying from 150 to 200 feet, where explored, and I entertain not the least doubt but that the ore will be found to a considerable depth, equally as rich and extensive as in the 30-foot level, and near the surface.

My experience in other mining countries enables me to make the following brief deductions, concerning the Treasure Hill mines:

First—The chief productive veins will be found to run nearly S. W. and N. E., with underlay invariably coincident with the formation of the country or mountain rock.

Second—The veins may be classed as segregated veins of large extent, with ore deposits likely to lie at varying distances horizontally from hanging to foot walls, and in the manner of the *stockwerk*, or layer deposits of the chief silver and copper mines of South America.

Third—It is most likely that if the formation at a greater depth changes from the present into porphyritic greenstone or slate, that these strata will be found barren, and that the limestone or dolomitic formation only will carry rich ores.

Fourth—No water is likely to be found to a considerable depth, and the veins are likely to carry richer ores down to the depth of 500 feet, than may be expected below that point; and no doubt the chloro-bromide of silver ores will change somewhat as depth is attained, into the compound sulphurets, arseniurets and native silver.

Mining Engineer.

New Defenses of the Scheldt.—A combination of forces, applied to purposes of war has lately been made the experiment at Antwerp with a view to the defense of the passes of the Scheldt. Torpedoes are placed in the river, and cameras similar to those used by photographers are adjusted, so that an object directly over one of them will present its image in the instrument situated upon the shore at any convenient distance. As soon as the image of an approaching hostile vessel appears in the camera, an electric current is sent through a wire to the torpedo which underlies it, and the explosion takes place.

[Written for the Mining and Scientific Press.]

Mining in Placer County.

Editors Press:—Since my last letter to you, I have been to the district where is located the

CHAMPION LEDGE,

spoken of in the letter referred to. There are now being made preparatious for building a mill upon it. This is decidedly a good district for gold-bearing quartz. There are several ledges in close proximity that will pay well, from the prospects that were obtained while I was there; but the Champion is apparently the "Mother Vein," as it carries the characteristic peculiarities of all of them, and I judge that it will prove in future a material source of wealth, considering its situation and locality.

GRAVEL MINES.

Regarding the mines close about here, the Jehosephat claims have just finished the first run for the season, and are cleaning up profitably. The Uncle Sam, on Cañon Creek, has been running with good results all summer. The cement mill is progressing to completion. There are a number of gravel claims running and doing well. The miners generally are busy fixing up for the coming water, and we expect lively times here as soon as there is plenty of water.

AN ANCIENT CHANNEL.

I wish to call attention to an old channel that runs east and west (apparently) along the main ridge above this place. There are several break-outs from it, in many places where there are quantities of quartz gravel that prospects well, but owing to a heavy, broken mass of scoria being deposited upon the top, it does not pay well to wash the whole of it. In the main ridge, in my opinion, there is as rich a lead as has ever been struck in California. There are many evidences of this; one is that the gravel shoved out upon the vein rock is rich, and it is under the broken fragments of scoria, a solid stratum of which covers the entire ridge for miles. When this is opened it will be very extensive. It will take some tunneling, but the work will be done, and I think that a joint stock company might employ capital in this locality to as good purpose as at any known place in the world. That this has been one of the main channels of ancient times, is shown by the deposit of scoria having filled the depression of the surface for several miles in width. If it is ever fairly opened, there is ground enough for thousands of men to work above Dutch Flat for the distance of twelve miles. This country is not prospected for the reasons named, no tunnels having been run into the main channel; however, in the streams at the foot of these breaks large amounts of gold have been taken out that I know of.

I will send you some samples of our quartz from this section, and you may comment upon it if you like. When I inform you that this old channel has worn deep through these ledges, you will, I think, agree with me that there must be an abundance of gold deposited in the bottom of the main channel. A. E. R.

Dutch Flat, Dec. 17th, 1868.

To Silver-coat Cotton and other Fibrous Material.—We find the following among the "Answers to Correspondents" in the *American Journal of Mining:* All animal and vegetable substances may be silvered by means of the two following solutions: No. 1 is composed of quicklime 2 parts; grape sugar or honey, 5 parts; gallic acid, 2 parts; water, 650 parts; filter, and keep in well-stopped bottles. No. 2 is composed of nitrate of silver, 20 parts; liquid ammonia, 20 parts; pure water, 650 parts. In order, now, to silver silk, wool, hair, flax, cotton, and other fibrous material by means of these solutions, they are first plunged for a short time into a saturated solution of gallic acid, and then into a solution of one part of nitrate of silver in 50 parts of water. This alternate plunging is repeated till the first black appearance of the substances gives way to a slight metallic luster; then the substance is ready to take the silver coating. To produce this, plunge the substance into a freshly-prepared mixture, in equal parts, of solution No. 1 and No. 2, and leave it until it is thoroughly silvered, after which it is boiled in a weak solution of salts of tartar, and dried.

Mechanical.

HEATON'S PROCESS AGAIN.—We have more than once spoken of the Heaton process for making steel from low class iron by means of nitrates; and have once referred to Prof. Miller's favorable report upon it. In *Engineering* for Oct. 30th, we find a page containing *four articles*, the writers of which, one after the other, indulge in a quiet "dig" at the "process," and which articles tend to put a different color upon the whole affair. The first laughs at the "Solon,"—as the writer calls him,—who insists that the Heaton is to supersede the Bessemer process, and that the result of the operation is *malleable iron of the purest quality, containing* 1.830 *per cent. of carbon!* The second article says that the Heaton process does essentially the same thing that the puddling process does, but not as well. The third shows that it would cost considerably more to make steel by this process than by any other;—and that the article made is not so good after all. The fourth of these articles is by a writer who himself took out a patent in 1860, which involves, as he claims, Mr. Heaton's of 1866; and adds that the lawyers will have to decide the matter. Worse than all, an editorial in the same number of the journal aforesaid, says that the use of nitrate of soda has been open to all since the lapse of the patent of Sir Francis Knowles, taken out in 1857! In the same journal again is reprinted a paper read by Mr. John Gjers, before the Cleveland Institution of Engineers, in April last, in which, after alluding to the experiment of Mr. Hargreaves in the same direction, the author says: "We can come to no other conclusion than that the nitrate process, as at present carried out, is a fallacy and a deception." It would appear, therefore, that the Heaton process is by no means likely to carry everything before it.

THEORY OF PUDDLING.—It has been generally assumed, that in puddling, the oxygen of the air from the draught combined with, and thus removed, the impurities contained in the iron,—such as silicon, carbon, etc. But in the paper recently read by Mr. Siemens, before the British Association, to which we have before referred, he asserts that he found the same effects produced with a perfectly neutral flame—that is, one with no excess of oxygen. He therefore concludes that the oxygen required is furnished by the fettling itself,—which is oxide of iron introduced to form a slag. This he considers to be proved by the fact that some of the fettling is reduced in the operation. The weight of wrought iron produced was fully equal, he says, to that of the pig employed.

BOLTS AND NUTS.—We gave a short time since the uniform system proposed for screw-threads. Here is the uniform standard for bolt-heads and nuts, which was recommended in December, 1864, by a committee of the Franklin Institute: "The distance between the parallel sides of a bolt-head and nut, for a rough bolt, shall be equal to one and a half diameters of the bolt, plus one-eighth of an inch. The thickness of the heads, for a rough bolt, shall be equal to one-half the distance between its parallel sides. The thickness of the nut shall be equal to the diameter of the bolt. The thickness of the head, for a finished bolt, shall be equal to the thickness of the nut. The distance between the parallel sides of a bolt-head and nut, and the thickness of the nut, shall be one-sixteenth of an inch less for finished work than for rough."

MECHANICAL EXHIBITION IN LEIPSIC.—In May of the present year, 1869, will be held an exhibition of machines "pertaining to mills, bakeries, and husbandry connected with such," under the direction of the Association of German Millers. All interested in mills in the United States are invited to take part.

THE BRIDGE ACROSS THE CHANNEL.—*Engineering* heads an article upon the projected bridge from Dover to Calais, "PONS ASINORUM;" and in allusion to the projector, M. Boutet, says:

Some six or seven years ago, we remember reading a leader in *L'Independence Belge*, in which the dawn of a new era was announced. Locomotives and steamboats were to be disposed of as old iron, coal was to be employed for domestic purposes alone, the steam horse was to be sent finally to grass, since we had but to retrace our steps to find that in the passage of the two primitive elements, air and water, from one india rubber bag to another, sufficient force was developed to make the world, or anything else, revolve as fast as the most go-ahead Yankee could desire. The benefactor of our species, then as now, was M. Charles Boutet.

We add a portion of the conclusion of the article: "We have given much space to investigate the project and criticise the projector with the vain hope of finding on grain of sense to leaven the whole mass. But the very magnitude of M. Boutet's projected bridge, as shown upon his fairly executed drawings, will take with many, and we ourselves have seen an audience of more or less influential men impressed by the projector's well conned, oft-repeated lecture, run off the reel as glibly as the rattle of a panorama expositor, and we have heard members of such an audience argue that the constructive details of this fallacy are correct, and that a great new principle of construction has been inaugurated by which powers of resistance are created—another phase of perpetual motion.

THE "SET" OF TWISTED WIRES.—M. Coulomb suspended a ball by a wire twenty inches long, connected with an index which would point out the amount of torsion. He found that when it was twisted ten times, the index returned to its primitive position, if repeated a thousand times, and the oscillations were made in equal times, whether wide or narrow. But if it was twisted *eleven* times, the index did not return to its place, but wanted nearly a whole turn of it. Here, then, the parts of the wire had taken new relative positions, in which they were again at rest. But what was most remarkable in Coulomb's experiments was this: He found that after the wire had taken this *set* (as it is termed by the artisans,) it exhibited the same elasticity as before. It allowed a torsion of ten turns, and when let go, it returned, and after its oscillations were finished, it rested in the position from which it had been taken.—*Prof. Mayer, in Jour. Frank. Institute.*

PRIMITIVE IDEA OF A LOCOMOTIVE.—Sir Isaac Newton, in 1680, figured a spherical generator supported on wheels and provided with a seat for a passenger in front, and a long jet-pipe behind, stating that the "whole is to be mounted on little wheels so as to move easily on a horizontal plane, and if the hole or jet-pipe be opened the vapor will rush out violently one way, and the wheels and the sphere will at the same time be carried the contrery way."

THE longest artillery range on record, viz., 10,301 yards, was attained at Shoeburynese, by Mr. Whitworth's 9-inch muzzle-loader gun of fourteen tons, firing a shot of 250 lbs. with a charge of fifty lbs. This range is 225 yards over that of the 6-inch Lynall Thomas gun, which in 1861 ranged 10,075 yards.

FOR CARS OFF THE TRACK.—Mr. C. H. James, of Canada, has taken out a patent for a machine which he calls the "Dominion Reverse Repeating Rail." It is used for assisting engines and railroad carriages back to the rail. The rail can be carried on every train, and two men can move it to any point required.—*Railroad Register.*

IRON AND STEEL INSTITUTE.—The iron-masters of Great Britain are moving towards the establishment of an Institute "for the discussion of practical and scientific questions connected with the manufacture of iron and steel."

SHARPENING SAWS.—"After filing your saw, lay it on a level board and pass over the side of the teeth with a whetstone until all the wire edge is off the teeth. This will make your saw cut true and smooth, and remain sharp longer. Your saw must be set true with a sawset."—*Cor. Sci. Am.*

IRON PROPS FOR MINES.—An English patent has been taken out for wrought iron tubes, plugged at their ends with wrought iron, to be used as props in mines instead of the timbers generally employed.

Scientific Miscellany.

Occlusion of Hydrogen by Metals.

We gave some time since an account of Mr. Graham's interesting experiments upon this subject. In those the metal plate was heated, and then cooled in an atmosphere of the gas. The *Chemical News* gives, in a recent number, a paper by Mr. Graham, describing a new method of charging the metals with the hydrogen at low temperatures. We give a part of that portion which refers to palladium: "If a plate of zinc be placed in dilute sulphuric acid, hydrogen is evolved from the surface, but none is occluded. But a thin plate of palladium immersed in the same acid, and brought into metallic contact with the zinc, soon becomes largely charged with the hydrogen, which is then transferred to its surface. The charge taken up in an hour by a palladium plate, rather thick, at 12° amounted to 173 times its volume.

The absorption of hydrogen was still more obvious when the palladium plate was constituted the negative electrode in acidulated water to a Bunsen battery of six cells. The evolution of oxygen gas at the positive electrode continuing copious, the effervescence at the negative electrode was entirely suspended for the first twenty seconds, in consequence of the hydrogen being occluded by the palladium. The final absorption amounted to 200·4 volumes, and was greater in amount than the volume of hydrogen occluded by the same plate heated and cooled in an atmosphere of the gas, which did not exceed 90 volumes.

It is worthy of remark that the gas exhibits no disposition to leave the metal at the temperature of its absorption. Thus a thin plate of palladium, charged with hydrogen, was washed, dried and sealed up in an exhausted glass tube. On breaking the tube under mercury after two months, the vacuum was found perfect; but on the application afterwards of a heat of 100°, 333 volumes of gas were evolved.

The occluded hydrogen is readily extracted by reversing the position in the battery, so as to cause oxygen to be evolved on the surface of the metal. The hydrogen is then drawn out as rapidly as it had previously entered.

SEPSIN.—The poison generated in putrefactive fermentation has recently been isolated by Drs. Bergmann and Schmiedeberg, in the form of a crystalline salt which they have named "*sulphate of sepsin.*" The London *Lancet*, says: It is obtained by diffusion through parchment paper, precipitation with corrosive sublimate from an alkaline solution, removal of the mercury by silver, of the silver by sulphureted hydrogen, evaporation, and purification of the residue. Large, well-defined, acicular crystals are thus obtained, which are deliquescent in the air, and, exposed to heat, melt and carbonize. They possess a powerfully poisonous action. A solution containing scarcely more than one-hundredth of a gramme was injected into the veins of two dogs. Vomiting was immediately induced, and after a short time diarrhœa, which in the course of an hour became bloody. After nine hours the animals were killed, and, on examination, their stomachs and large intestines were found ecchymosed, and the small intestine congested.

"IVIGTITE"—A NEW MINERAL.—Theo. D. Rand describes a new mineral for which he proposes the above name, on account of the locality where it is found. It occurs in films and seams through massive cryolite. The color is pale yellowish-green, sometimes yellow. Hardness 2-2.5, sp. gr. 2.05: Fuses rather easily before the blowpipe; with carb. soda fuses readily and with effervescence to a greenish bead. In borax dissolves readily with an iron reaction. In microcosmic salt dissolves readily except silica skeleton; bead yellow while hot, bluish opalescent when cold. In closed tube yields acid water.

DECOMPOSITION OF OIL OF TURPENTINE. Prof. Wurtz, in the *Gas Light Journal*, translates from the proceedings of the Vienna Academy, an account of the experiments of Hlasiwetz and Hinterberger upon the repeated distillation of the products resulting from the subjecting of oil of turpentine to a red heat. Vapors of turpentine were passed through a red-hot iron tube filled with fragments of porcelain. The products were a gas, some carbon (as a mirror-like black crust on the porcelain) and considerable dark brown oily liquid of benzole-like odor, lighter than water. The gas burnt like illuminating gas. One hundred measures of turpentine gave on an average 60 of liquid, and about 16,800 of gas; and the carbon amounted to about 2.3 per cent. of the material employed. The brown liquid distilled with water, gave 81 volumes per 100 of a gold-yellow oil of a much purer and pleasanter smell than before, and a tarry residuum. This rectified product was nearly one-half (in volume), of the turpentine employed. It was dried by fused chloride of calcium, and subjected to fractional distillation.

Prof. Wurtz, says: "It may be doubted whether any field more richly pregnant of results of economical value presents itself to-day to competent chemists, than investigations of the products of various chemical treatments of oil of turpentine and common rosin. * * Chemists will agree in the importance of finding some liquid, cheap and obtainable in abundance, which will vie in solvent power and volatility with the expensive benzole (that is, true coal-tar benzole, not the common cheap petroleum naphtha or "benzine," which is almost universally confounded in commerce with benzole), and that still more expensive, but noble solvent, chloroform."

FOSSIL HORSE IN NEBRASKA.—In the November number of the *American Journal of Science and Arts*, Prof. O. C. Marsh gives a notice of the remains discovered in Nebraske during the past summer, of a new species of fossil horse, very much smaller than any heretofore known. The newspapers, in their first published accounts, described them as human remains. They were found at Antelope Station, on the Union Pacific Railroad, 450 miles west of Omaha, and were thrown out from a depth of sixty-eight feet, during the digging of a well. Some of these remains were described by Prof. Marsh, at the meeting of the National Academy of Sciences at Northampton in August last. "They indicate," says the Professor,—"an animal scarcely more than two feet, or possibly two and a half feet in hight, although full grown, as the ossification of the various bones clearly proves. The species may be named *Equus parvulus*. This makes seventeen species of fossil horses now known to have lived in North America, although until quite recently it was very generally believed that there was none indigenous to this continent."

The bones were found in a stratum of gray arenaceous clay lying nearly horizontally, and apparently of later Tertiary age.

ALCOHOL AS FOOD.—The following is a paragraph from a lecture on food recently delivered by Dr. Letheby before the Society of Arts (England): Liebig is of opinion that alcohol is burnt or oxidized in the system, and is therefore a calorific agent; but the researches of Lallemand, Perrin and Duray, as well as those of Dr. Edward Smith, have demonstrated that a large portion of it passes through the system unchanged, and appears in the breath and perspiration, as well as in the urine. They, therefore, conclude that alcohol is not a food, but is a mere excitor of the nervous centers. On the other hand, Dr. Thudicum in a rather large experiment on the students of his class (33 in number), found that of the 4,000 grammes of alcohol in the 44 bottles of wine which they drank at one sitting, only 10 grammes appeared in the urine; and assuming that about 10 grammes more were exhaled by the breath and skin, he concluded that only 0.5 per cent. of the alcohol escaped unchanged. He therefore believes that alcohol is oxidized in the body, and is a true food.

Geological Survey Map.—A new edition of this excelleut map of the Bay Counties has just been received at Payot's, from the Eastern publishers. Numerous valuable additions have been made, such as the coloring of county boundaries, the marking of roads, etc.; the price being $6.50, instead of $5, as formerly; but the geological formations are not yet represented. As the data are all, years since, in hand, there is surely no good reason why the value of this map should not have been enhanced by their representation in colors. Local geologists would have found the map much more interesting, and the Geological Survey would not have been wanting thereafter for a body of local friends. The only attempt towards a representation of the geological features of California which is at the service of persons taking an interest in the matter,—embracing every citizen in the State, and especially every miner,—is in the little volume of Tyson, dated 1849, which gives an intelligent account of a two-months' reconnoisance up the valley, with maps noting the lithology as observed, and sections representing the relations, dips, extent and profiles of the different formations—across the Coast Range, the valley of Sacramento, and the foot hills, as far up as the granite region of the Sierra Nevada. California and Nevada *must* be mapped, and represented geologically; but the probabilities now are that the principal contributions to that end will have to be made by private enterprise, if not also from private data and resources. The number of observers in California who would be able to contribute to the general knowledge as to local geology and the special characteristics of our mineral deposits, is not small; but neither the Geological Survey nor the Academy of Sciences seem to have quite succeeded in bringing that element to a satisfactory union, or to have associated together the kindred spirits into such active coöperation as might be done, for mutual profit.

Venezuelan Mining.—The mining region between Quito and the mouth of the Orinoco has been one of infatuation for buccanneers and mining engineers, ever since the days of Walter Raleigh. Ancient mythical rumors of a wealthy city hidden in the forests and mountains, where silver and gold are common drugs, still circulate amongst the superstitious. Robert Stephenson, the father of railroad engineering, spent years there in trying to do something for an English Company—and there are still English Companies operating in the country, with what degree of success we are unable to state, except that there is a constant repetition of demands for competent engineers and metallurgists from the older mining districts of Europe, who return, and go to California or Australia. Dr. B. B. Stevens, a New York chemical geologist who recently visited that country, says the veins are not of the richest. His opinion is that the metamorphic rocks invariably yield more gold than any other—a proposition which has been otherwise frequently stated in the common expression that it is in the vicinity of eruptive action where the precious metals are most plentifully found.

Mining Atlas.—Mr. Spargo, of Gresham House, London, is about to publish an atlas of all the chief districts prolific in metals in the world, excepting those which yield iron exclusively, or nearly so. The atlas first depicts Devonshire, Cornwall, portions of Wales, and the Isle of Man. The geological formations of those districts are by a simple plan made obvious at a glance. The leading tin, copper, and lead mines are described as to their operations, quality of ore, prospects, etc., and longitudinal and transverse sections show the character and working of each. The mines of Nevada, Colorado, Idaho, New Mexico, Wisconsin, etc., are mapped out with minute care and accuracy. The railways which connect the Atlantic and Pacific oceans are also represented.

John Mitchell, the Assayer.—Concerning John Mitchell's death, the *London Mining Journal* says: Our readers will regret to hear of the death of John Mitchell, the eminent assayer and metallurgist, which occurred in Valparaiso, on May 11th, under very distressing circumstances. Mr. Mitchell was for sometime a regular correspondent of this journal, and contributed a series of well-written articles on many interesting and important topics, amongst others, as will be in the recollection of our readers especially connected with the iron trade, were several excellent letters, in which he maintained a spirited controversy with Mr. David Mushet a few years ago. During the last year or two he had been engaged in preparing for the press a third edition of his admirable "Manual of Practical Assaying," and we understand had almost entirely re-written the book, introducing all the most recent and improved methods. As the last edition is out of print, we trust his manuscript may be placed in the hands of some one who will bring out the work in a manner in which the reputation of its talented and lamented author will be fully sustained.

The Polytechnic Society which has been organizing at the Mechanics' Institute, is meeting the encouragement and support of the class on whose interest and intelligence its usefulness will in a great measure depend—the practical and scientific artisans, mechanics, miners etc., of this city and State. Another meeting, to perfect the organization, will take place at the Mechanics' Institute on Monday evening, January 14th. The dues have been limited to $1 per quarter. All who intend to sustain the idea of a Polytechnic Society, or to benefit by association with the kind of persons whom it will bring together, can send in their names to the committee—Messrs. A. S. Hallidie, Wm. F. Herrick, John J. Hucks, E. T. Steen, Amos Bowman, and J. H. Culver.

Jacoby's California Staats-Kalender. This is quite a respectably sized volume, of nearly 200 pages, containing, besides its magazine of advertisements, a large amount of interesting reading matter of special value to Californians, or intending emigrants, amongst which the following are original: "A general review of the events of 1868 in California; the agriculture of the State; its gold mining; its railroads; its chief city; the wonders of its scenery; German associations in San Francisco and in Los Angles; the Mechanics' Fair of 1868; and an account of the publishers' trip to Europe and back."

Mining in Placer County.—From "W. H. M.," (dated Auburn, Dec. 14th,) we learn that the Pioneer Mill of six stamps, in that vicinity, driven by water-power, is now running, and doing well. The ledge is located six miles from Auburn; it is eight feet wide, and the shaft is 40 feet down; Mr. J. M. Gallard, being both proprietor and superintendent. The Bald Hill Mill is also going. It has twenty stamps, and is located 3½ miles from Auburn. The ledge is opened eighty feet down, and they are running a tunnel from the surface to the main shaft. Mr. C. Fay is one of the owners. Placer diggings seem to be "played out," and all the talk is about quartz. Welthoy's old steam mill is going and doing well, being engaged on custom work at present. They have just made a clean up for some of the boys that are out prospecting, and it paid from $3 to $35 per ton. "So you see," says our correspondent, "that there is gold in the quartz in Placer County, as well as in Nevada County. I think it will be a big thing."

Perambulating Disinfectant.—A perambulating disinfectant wagon has been making the rounds on Kearny and other streets during the week,—a cask with a small hose attached. The smell of chlorine gas was unmistakable.

The Railroad to the Presidio *via* Sutter street has been completed.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

For the Week Ending December 8th.

84,737.—Improvement in Door Locks.—Chas. Fleischel and Wm. C. Bussey, of San Francisco, Cal.:

The plate K, fastened upon the bolt of the lock, and provided with the wards *c*, *c*, and *c*, in combination with the cylinder B, disk C, and revolving tumblers F, F, substantially as described, and for the purpose set forth.

This invention consists in the construction of an improved revolving tumbler lock, which is especially adapted for use on the outer doors of stores and large buildings in which a secure, and at the same time cheap lock is required. This is accomplished by constructing a case through which is made an opening connecting with the outside and inside, and in which turns a short shaft, which is spread so as to form a disk inside the case. Two plates rise from the inner surface of this disk, and between these plates are placed a number of tumblers, consisting of elongated metal plates, having slots in one end at various depths from the bottom of the case, through which the wards pass when they are in a line, caused by the introduction and turning of the proper key.

The bolt passes through the side of the case which supports and guides it. Within the bolt forms a flat bar which extends along the bottom across the case, and has a slot in it. A screen passes loosely through this slot and into the side of the case, and thus guides that end of the bar, so that the bolt moves freely without any tendency to bind.

A steel plate is fastened to the bolt inside the case, and has its edge formed into wands corresponding to the number of the tumblers. The disk on the inner end of the tumbler shaft, has an arm projecting from one side, which enters a slot in the extension of the bolt, and thus moves the bolt.

On the other side of the case is a bent arm pivoted at one end and having a point at the other which enters a hole in the bolt to prevent its being moved when drawn back, and by an equivalent device prevents its being withdrawn after being shut out. The bent arm is operated when the key is introduced and turned, by an arm or lug which projects from that side of the disk, and raises the arm sufficiently to allow the bolt to pass, after which it drops into place again.

84,742.—Improvement in Ship's Davits. Seth Gill, of San Pablo, and David C. Woods, of San Francisco, Cal.:

1. The jointed davit-arms E, E, with their tackle, or an equivalent device, the whole constructed and operated substantially as and for the purpose herein described.

2. In combination with the jointed arms E, the traveler L, with its in-haul and out-baul tackles M and N, substantially as described.

3. In combination with the davit-arms E, the uprights D, with the lifts H, and stanchion I, the whole connected by rods with the davits on the opposite side, substantially as and for the purpose herein described.

The object of this invention is to provide an improved device for handling the small boats connected with a vessel so that they can be launched at the shortest notice in an emergency, while they are securely placed when not in use. This is accomplished by a peculiar construction of the davits so that the suspended boat moves by means of travelers operated by the necessary tackle from its position when not needed, to a sufficient distance from the ship's side to ensure its safety in lowering. The davits are also so constructed that when coming into port or whenever desired, they can be instantly turned so as to leave the ship's side perfectly clear and smooth with no projections. They are also attached to davit uprights or standards which pass through the decks and into the plank shear. The standards on opposite sides of the vessel are connected at the top by stay rods with a turn-buckle between so that the strain is rendered much less than in ordinary constructions. An illustration of this device may be expected in a future number of the Press.

84,748.—Improvement in Gang Plows.—Francis McTarnahan, of Santa Clara, Cal.:

1. The frame or ground work of the gang plow.

2. The combination and arrangement of the beam R, to which the plows are fastened, the beam to which said plow-beam is fastened by hinges, the semi-circular hinges, as constructed, and the manner of fastening the plows in the beam, all as shown.

3. The screw-slides A, in combination with the frame.

4. The combination and arrangement of the beam L, to which the lever is fastened, the post on which it works, the chain, the pulley on which it works, the evener and the guard, all as described.

5. The square block D, under the axle-tree, for regulating the amount of land, in combination with the evener.

6. The construction, combination and arrangement of the several parts, as shown and described.

84,778.—Automatic Stop for Mining Cars.—James Tamblin, of Virginia City, Nev.:

The projections or stops E, E, arranged with the levers C, F, and spring H, connected with the chain G, and all applied to operate in the manner, substantially as and for the purpose herein set forth.

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Chloride Flat and Aurora Tunnel Co.—White Pine, Nev. Dec. 24th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: A. E. Head, Mark Livingston, W. B. Thornburgh, I. N. Taylor and R. F. Morrow.

Continental Silver M. Co.—Dec. 24th. Capital stock $5,000,000; 10,000 shares, $500 each. Trustees: H. H. Blake, A. F. White, B. F. Bivens, W. B. Swain and Caleb T. Fay.

Kimball Manufacturing Co.—San Francisco. Dec. 24th. Capital stock, $500,000: 5,000 shares, $100 each. Incorporators: Geo. C. Kimball, R. D. Ogden, W. C. Ralston, A. Hayward, H. B. Tichenor, McPherson & Wetherbee, A. P. Hotaling, Rosenfield & Birmingham, A. B. Forbes, E. Cahill, Koopmanchap & Co., Louis McLane, Chas. McLeau, Oliver Eldridge, Thos. H. Selby, Meeker, James & Co., John Parrot, DeWitt, Kittle & Co., Wm. Burling, C. J. Brenham, James D. Walker and W. F. Babcock.

Flowery Kingdom M. Co.—Story Co., Nev. Dec. 28th: Capital stock, $1,200,000; 12,000 shares, $100 each. Trustees: A. H. Barker, Chas. Hosmer and O. S. Carville.

Montgomery Street Real Estate Co. San Francisco. Dec. 29th. Capital stock, $7,500,000; 75,000 shares, $100 each. Trustees: Jno. D. Fry, Leonard S. Treadwell and Ashbury Harpending.

Election of Officers.—Gould & Curry S. M. Co.—President, Alpheus Bull; Trustees, Alpheus Bull, Thos. Bell, J. D. Fry, A. K. P. Harmon, M. Morganthan, A. Hayward and Thos. Sunderland.

The North Star G. & S. M. Co. have filed the necessary papers for an order to allow them to disincorporate the company.

Patent Turbine for Sale.—The patent right for Leffel's American double turbine wheel for the Pacific coast, is offered for sale in our advertising columns. This wheel is largely in use in the Eastern States, and has been highly recommended in this State.

The Annual Meeting of the California Academy of Sciences will take place on Monday evening, January 14th, when the officers for the ensuing year will be elected.

Religion is a good thing; Benevolence is a good thing; Politics are a good thing; War is a good thing; Money is a good thing; Pestilence and Famine are good things, and it is so with a hundred other matters with which we at times imagine we are cursed or blessed. Hard as these afflictions may seem, they all result in good, one way or another. It is particularly so with Plantation Bitters; but they must be used with moderation, and according to the directions. You must not abuse or indulge in them too freely. If you do, like other blessings, they will do harm by an over-indulgence or abuse. *

To Scientists.—The museum of natural curiosities at Woodward's is well worth an examination by every lover of nature, saying nothing of the living animals, the botanical garden, and other attractions. *

Muller's Brazilian Pebble Spectacles, 205 Montgomery street, cannot be surpassed by anything in this line. *

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, January 2, 1869.

City Stocks.

During the past week the sales of miscellaneous stocks, despite the holiday season, have been very considerable. Spring Valley Water stock was in the market to a larger extent than usual, selling at $65@65 50 ₱ share. California Steam Navigation declined from 52½ to 50½ per cent., then sold at 52. A vigorous opposition is being inaugurated by this company against the railroad company, the faro to Sacramento having been reduced to $2. San Francisco Gas stock is in request at an advance, selling at $79, then at $80 50, buyer 30. The usual monthly dividend is now payable. The California Insurance Co. will add Fire to their Marine business on and after the 1st of January. The Pacific Bank disburses its usual monthly dividend to-day. At the close U. S. 5-20s of 1867 sold at 83.

Mining Share Market.

Taking into consideration that we are in the midst of the holiday season, the mining share market has been quite active, large sales having taken place, though, as a general thing, at a slight recession from opening rates. The transactions also embraced a larger list of stocks than is usually offered.

Under the caption of "White Pine, the wonder of the world," the *Alta* comments as follows: Although only about three months have elapsed since the first noteworthy shipment of bullion from White Pine reached this city, that district has already become one of the most populous in the great inland basin of the continent. The number of men now in the vicinity is 3,000 or more, and of these 1,000 are engaged in taking out ore, the quantity extracted daily being about 300 tons, and average value is estimated by one excellent authority at $500 per ton, and by another at $200. A man who worked in a custom mill informed us that he had worked ore from thirty-five different mines, and only two lots out of the thirty-five yielded less than $150 per ton. At $200, the yield of a year counting 300 working days, would be $15,000,000—that as if the supply of ore should not be exhausted. A much greater quantity could be taken out now, but there are not mills enough to reduce what is being extracted, and many of the claim holders make great sacrifices to raise the cash for necessary expenses, and it would be a serious loss to them to pay miners for work from which no income could be derived before next summer. If the deposits are as extensive as they now appear to be, the yield of the district in 1869 will astonish the world. The Eberhardt Company, who own the typical mine of the district, have worked 700 tons which assayed $1,000 per ton, and yielded $850 in the mill—a total production of $595,000 from that one mine alone. They have on the dump and at the mill 600 tons of ore, and they have 500 tons more "in sight"—as rich as that heretofore reduced. Counting the ore reduced, that extracted and that in sight, the Eberhardt is certain to produce at least $1,500,000. They have, however, not gone down more than forty feet, and they have not reached either the bottom, or the eastern or western limit of the deposit. A drift of 184 feet, cut with the meridian, has struck the walls on each side. The Keystone mine, which ranks next to the Eberhardt, has worked 350 tons averaging $700, and has extracted 1,000 more which average $400, making the gross value of the ore produced so far, $645,000. The Robert Emmet has taken out 100 tons and worked 61, of which 20, first-class, assayed $1,215 per ton; and 41 tons of second-class assayed $485 and yielded $341 net. The Stonewall has taken out 200 tons, and reduced 60, which yielded $500 per ton. The South Aurora has out 500 tons that will average at least $150 per ton; the North Aurora is taking out 20 tons per day, worth $150. The Eclipse, a claim that has attracted little attention, comparatively, has been sold to J. D. Winters, the Superintendent of the Yellow Jacket mine, for $35,000. These are only a few out of many. An area two miles wide and six miles long appears to be underlaid by an argentiferous deposit similar to that in the Eberhardt. More than a hundred shafts have been sunk, and nearly all have found the ore within fifty feet, most of them within thirty feet of the surface. Mineral deposits in limestone, which is the bed-rock at White Pine, are ordinarily of small extent and soon exhausted; but the newly-discovered deposit is certainly an exception in regard to its extent. The silver mines of Chañarcillo, in Chili, are in limestone, and they have been worked steadily for thirty-six years and have produced $60,000,000. There, as at White Pine, the lodes near the surface contained large quantities of chloride of silver, which could be mined and reduced at very little expense. Nearly a hundred years ago, a deposit similar in many respects to that at White Pine, was found at Catorce, Mexico, in the Zavala mine, which yielded $7,000,000. Ward says the ore was "a loose metalliferous substance, so completely impregnated with particles of silver that it was bought up at once by the *rescatadores* [amalgamators] at the price of one dollar for the pound." The amalgamators, who were and still are distinct from the mine-owners, in most of the mining districts of Mexico, seldom paid half as much as the ore would yield, so it is fair to presume that the Zavala ore would assay $3,000 or $4,000 per ton, and that is quite up to the average of White Pine. We do not find in any of our books of reference a description of the geological formation at Catorce, but it is said that the richest ores were found in vaults (*bovedas*) or caves, which are common in limestone and rare in other formations. At Guanisamey, in Durango, there was another vault filled with rich dirt-like ore, which yielded a rich profit to Zambrano, one of the most famous miners of Mexico. In twenty-five years he took out $55,000,000. The records show that he paid $11,000,000 tax to the King. The chloride ores at White Pine may not last so long as did those at Chañarcillo and Catorce, but if the testimony of a number of witnesses of good repute is to be accepted, they will certainly prove the wonder of the world for a year or two, and give a great stimulus to business of all kinds on the Pacific slope. Many, however, who abandon their present occupations to go to the new diggings will lose far more than gain.

Gould & Curry—was in the market at $103 @95, and closed at $00. The annual meeting of this company was held on the 28th of December. From the Secretary's report we take the following:

RECEIPTS.

Cash on hand, December 1, 1867	$147,914 15	
Ores sold	43,959 29	
Bullion account—Company mill	29,127 07	
Bullion account—Custom mill	22,108 56	
Materials sold	16,226 76	
Tolls on Virginia and Carson river road	4,130 43	
Ore scales at mine	147 72	
Interest	249 17	
Bills payable	3,875 90	
Cash indebtedness	33,822 09	
		$301,680 24

DISBURSEMENTS.

Mine account	$180,108 52	
Mill account	50,925 30	
Dividend account	3,465 00	
General expense account	17,737 37	
Reduction of ores at Custom mills	15,510 82	
Mill repairs	9,072 57	
Taxes	5,851 38	
Legal expenses	3,268 50	
Bills receivable	8,559 46	
Virginia and Carson River road	4,371 19	
Sundries	3,010 04	
		$301,680 24

The assets and liabilities of the company at the close of the fiscal year are as follows:

ASSETS.

Bills receivable	$18,612 29
Ores, tailings, etc., on hand	51,500 00
Real and personal property—mine	156,823 92
Real and personal property—mill	218,986 27
Boarding house at mine	3,750 00
Reservoir tailings' mill	22,884 61
Assay office, etc	7,711 68
Virginia and Carson River toll road	6,750 00
Office in San Francisco	1,000 00
	$487,923 77

LIABILITIES.

Cash indebtedness, etc	$29,532 31
Bills payable	3,875 00
Dividends uncalled for	535 00
	$33,942 31

Imperial—declined from $115 to $111, and closed at $109. For the month of December, up to the 28th, $23,765 85 in bullion was received. On the 29th ult., the station at the 1,100 level was in seven feet from the shaft, running in the same body of clay as found in the shaft. The winze on the 900 level is down twenty-six feet; in hard quartz with but little water. No change in the Alta mine. They raise about 140 tons of ore per day.

Empire—rose to $130, and at the close sold at $125. In his annual report the President says: "From the recent developments of ore in the Alpha and Imperial mines, on the 900 level, I am hopeful of getting a body of pay ore between our 900 and 1,100 levels."....Kentuck ruled at $240@267, and closed at $257. The receipts of bullion for December account foot up, so far, $53,952 47.

Crown Point—was pretty active, selling at $53@55, and closing at $53. On the 27th of December the shaft had attained a depth of 1,083 feet. It will be carried ten feet below the 1,100 level, which, at the progress they are at present making, will take about a month. The south drift is in 314 feet from the Kentuck south line, the east clay wall continuing to turn to the west. On the 26th of December they had reached a clay wall, which is said to have every appearance of the west clay, in the face of the drift. If it should prove to be the west clay wall, says the Superintendent, it will demonstrate that the walls inclosing the vein are converging going south, and that anything found in the unexplored region between the face of the south drift and the north of the Belcher, will be a new body.

Chollar-Potosi—sold at $150@153, then at $150, and closed at $153. During the week ending December 25th, 1,261 tons of ore were extracted from the mine. The supply is not quite so abundant as heretofore....Overman was in ordinary request, selling at $89 50@83 50, closing at $88. The receipts for December will foot up about $60,000. The Brunswick mill shows a better yield for December than it did the previous month.

Hale & Norcross—has been less active than the previous week, declining from $50 to $44, and closing at $45 50. The workings of this company at the mine have been kept very quiet for the past fortnight or so. We have been unable to obtain anything definite, but should judge from the transactions in the Board that the developments are not any too favorable....Savage—fluctuated between $84 and $78, closing on the 31st December at $78 75....Yellow Jacket advanced to $1,412 50, dropped to $1,366, and closed at $1,450. Information concerning both the Savage and Yellow Jacket chims is very difficult to obtain.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK:

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR JANUARY, 1869.

The following Steamships will be dispatched on dates as given below:

January 6th—SACRAMENTO.....Capt. W. H. Parker, Connecting with ALASKA, Capt. Cray.

January 14th—MONTANA.....Captain A. We

Connecting with RISING STAR, Capt. King.

January 22d—CONSTITUTION.....Capt. Wm. H. Hudson, Connecting with HENRY CHAUNCEY, Capt. Connor.

January 30th—GOLDEN CITY.....Capt. W. F. Lapidge, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched on MONDAY, January 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Dec. 19th: Supt. Gamble commenced a dowuward movement on the main shaft of the Morning Star mine on Monday.

Besides the Morning Star Co., and the Monitor Consolidated Co., thero are four mining companies iu the vicinity of Monitor, Imperial, Mt. Bullion, Globe, and Michigan,—each working five men, and all purposing to eontiuue full gangs through the winter.

The Tarshish Co. have at last succeeded in raising $75,000 working capital.

Chronicle, Dec. 19th: A few days since a 14-inch strata of very rich quartz was cut in the Gould & Curry tunnel, on Wiseman's claim. Mr. Wiseman is going np on the ledge, and this strata has widened to about 20 inches. The quartz is said to be easily worked.

The prospects of soon striking the Pennsylvania ledge, and that it will be a rich one, are so good, a large number of claims have lately been taken up on it for a distance of ten miles, it being plainly traceablo the entire distance, with the exception of about 200 feet.

The Markleeville correspondent writes that the Pioneer quartz mill has shut down to make some improvements.

AMADOR COUNTY.

Dispatch, Dec. 26th: Mr. Siebenthaler has recently refitted the old Tynan qnartz mill, a short distance above Volcano, and commenced crushing the quartz taken from his lead, which is paying handsomely. Wo are informed that several other leads have been recently discovered in that vicinity, which promise an abundant yield as soon as they can be opened and placed in working order.

The proprietors of the Coney mine, near town, have put up a couple of Paine, Stephens & Harry's new concentrators, for the purpose of saving sulphurets.

We learn that a rich lead has been discovered, and is now being opened, near Sutter Creek, by a couple of Austrians. Although the lead, so far as it has been developed, is but a few inches in thickness, the rock prospects sufficiently rich to insure a handsome return for working it—$300 having been taken from 15 pounds of the quartz, by means of a hand mortar.

INYO COUNTY.

Los Angeles *News*, Dec. 22d: Mr. Westerville, with two wagon loads of silver and lead bars, weighing 5,000 pounds, arrived in this city on Saturday evening last, from the Owon's River silver mines. He reports the furnaces in active operation day and night, turning out large qnautities of bars daily. They have discovered a fine quality of fire-clay in the vicinity, and the difficulty heretofore experienced of makiug the furuaces stand the heat, has been obviated. Wr. Westerville says that there will be 35,000 pounds of bars shipped to this place in a few days.

MARIPOSA COUNTY.

Gazette, Dec. 25th: The Oaks & Reese Mining Co. still continue to extract very rich ore from their elaim. This eompauy are adding to their works a new battery of four stamps; also, a concentrator and discharging grinder. When these improvements are completed—making it then a 16-stamp mill—the company will be able to operate still more successfully than heretofore. This company intend in the spring to reopen the Floyd mine, and also make other improvements.

The mine lately opened by Woolcock & Johnson, and noticed by ns some weeks since, has proved to be a pocket vein, and does not turn out as rich as reported. They realized a suug little sum, however, from this pockct, and are going ahead in constant hopes of striking another still richer.

NEVADA COUNTY.

Transcript, Dec. 22d: John Hughes and others have located 1,100 feet on a ledge on the south side of Wolf Creek, one mile southwest of Grass Valley, and called it the White Pine ledge.

The people of San Francisco look at the specimen rock from White Piue, and read the account of assays, and straightway go crazy abont tho richuess of the new district; but the miners of Nevada County certainly ought to know that a rich specimen or a large assay is not conclusive evidence of the richness of a mine. There are 50 mines iu Nevada County from which rock can be obtained that will beat anything that has yet been discovered in White Pine. The quartz mines of this county are not yet developed; their development is slow work. In Eureka, Meadow Lake, Grass Valley and Nevada townships, there are hundreds of mines that have not been thoronghly prospected, which give good evidence of richness. They show good rock and excellent assays. People do not go crazy about the quartz mines of this county, because they are not far enough away. The quartz mines of Nevada County if located in Mexico, would carry off one-third the popnlation of the State. Our people remember that within a few years, Fellows took $50,000 from a ledge in a few weeks, with a haud mortar. This story, told of White Pine, would start a score of men; but as it was done in Nevada County, it did not create so much excitement. Hnndreds of rich strikes in this county might be cited, giving more evidence of great mineral wealth than has beeu given in regard to White Pine, and if men would go to work, there are better chances of making money tban any offered in the new district.

The North Bloomfield Gravel Co. expected to complete their ditch to Columbia Hill yesterday. This line of ditch has been bnilt from Little Cañon Creek to Columbia Hill via North Bloomfield, within a few months. The company own gravel claims at both places, and expect to do a great deal of work in another season. The entire ditch is built in the most substantial manner.

Gazette, Dec. 21st: Of late, Mr. Maltman has been almost constantly employed on sulphurets from the Banner mine, which yield on an average $120 per ton. After the Banner mill shall have ten more stamps added to its crushing power, it will be able to furnish Maltman's works sulphurets enough to keep them running up to their fnll capacity. M. M. has worked nearly all the sulphurets from Soggs, Cornish, Pittsburgh, or Wigham, aud various other mines in Nevada township, aud has been able to save a larger per ceut. of the precious metal than any other similar establishment in the county.

Dec. 23d: Black & Young's mill, at Eureka, started up on Monday last, having contracted for a winter's job at $100 per day, crushiug rock from the Banberry & Co's ledge. The Banberry rock does not pay as largely as rock from some other ledges, but it yields enough for good dividends.

Dec. 24th: The proprietors of the Birchfield diggings have warned the authorities to widen the flume in the lower portion of Kelsey's Ravine, so as to allow the tailings from their mine to pass through freely. The company intend to run off a large amount of gravel this winter.

The old Manzanita claims, owned by Marselus & Maltman, are now being put in complete order for hydraulicing, and work will he commenced on them in a few days.

Grass Valley *Union*, Dec. 25th: Yesterday, some splendid specimens were brought to Findley & Co's bank, from the Bowery ledge. This ledge is a new location, and is an extension of the famous Seven-thirty. The specimen we saw is a large one, aud is specked with gold on every side.

SIERRA COUNTY.

Downieville *Messenger*, Dec. 26th: The rain of the last few days is a good thing for the mines. It will enable those whose dumps are full to wash their dirt, and to keep their drifters at work. There was 18 inches of snow on the ridges before the rain commenced, aud as this storm has beeu all rain, there should be a fair supply of water for washiug drift dirt.

SISKIYOU COUNTY.

Yreka *Union*, Dec. 19th: E. H. Hall still continues work on the Scoles quartz ledge, and finds an improvement in the quality of the rock as he goes down. The ledge 50 ft. from the surface, is two feet in thickness.

YUBA COUNTY.

Marysville *Appeal*, Dec. 24th: The steam boiler at the Pennsylvania mill, Brown's Valley, gave out on Tuesday afternoon or evening, and the mill came to a standstill. Materials for repairs were sent for, and by mistake they were put on the Nevada instead of the Browu's Valley stage. The mill, it is expected, will be running agaiu by to-morrow. We also hear that the rock is paying well, with strong indications of stayiug with the company for a year or so.

COLORADO.

Central City *Herald*, Dec. 9th: Mr. Schellinger started np the Montana mill last evening.

The Smith & Parmelee mine is now yielding five cords of ore per day.

Warren Hussy & Co. have bought and shipped dnriug the past eight days 1,800 ozs. of bullion worth $40,000.

A shaft has been sunk on the Wall Street lode in a depth of 25 ft., showing an ore vein 2¼ ft. wide, which is composed of gray sulphurets and quartz containing silver, as shown by fire assay, all the way from $196 to $3,000. A quantity of the ore has been treated by Huependen & Wolters which yielded 160 ozs. per ton.

Central City *Register*, Dec. 10th: The Brastow mill in Lake Gulch is working constantly on ores from the Bobtail.... Col. Tannat's mill at Mountain City started up on Wednesday. It has 30 stamps.... We saw in Clark's bank, last evening, two beautiful silver bricks weighing 800 ozs., the product of the California Reduction Works.

A correspondent writes from Ward district, that the Edge Hill is running on surface rock with good results. That the Ni-Wot Co's shaft is being driven down as rapidly as possible, and that it is the intention to sink it to a depth of 600 ft.; $25,000 has been taken from surface rock in that district the past season, by the labor of 20 men.

Prospecting is being vigorously pushed in the vicinity of Georgetown and Mill City, and some very promising lodes have very recently been discovered. Some colored men got on to Mr. Snyder's "Snow lode last week, and "struck it rich" within abont 200 ft. of the discovery.

Yesterday a single retort of gold bullion weighing 800 ozs., and worth $17,000, was on exhibition at Warren Hussey & Co's banking house. It was crushed from ores of the Pleasant View mine by 25 stamps of the Briggs mill in three week's time.

Denver *News*, Dec. 9th: Mr. Wells, of Lake County, has shown us a very rich sample of gold quartz from a lode lately discovered in California Gulch. One mill at Granite took out $8,000 from 50 cords of quartz.

Bernard & Studt, at California Gulch, while working on the Pilot last week, struck a very rich pocket, out of which one pan of dirt yielded 99 pwts. of gold. Several remarkably rich specimens were also found, one of them weighing about a pound, estimated to contain eight ozs. of gold. It is said they have panued out in all $600 from the pocket.

At Granite district theroare five lodes being worked. W. B. Feltou is still rushing the Magneta down; it is now 80 ft. deep with six ft. of ore, It is the best developed lode in this district. Morrison is sinking on tho Jessie Johnson, which also looks fine. D. C. Travis is opeuing a hole through the Yankee Blade Mountain. Thore is but one mill running at present. Mr. J. J. Walley is crushing from the South America.

DACOTAH.

Sweetwater *Mines*, Dec. 9th: The ore from the Dyer ledge exhibits free gold in abundance, and it is a well-defiued ledge, with good wall rocks, and a vein of ore between three and four feet in width. The Eureka and Mineral Star lodes are well-defined.

The progress made in developing the resources of that sectiou of country for the length of time siuce its discovery, is greater than that in any other sectiou of country that we have heard of, if we except the re-rccently discovered White Pine district in Nevada.

Several sales of great importance have been made recently, viz., 600 feet of the Miners' Delight for $18,000; 800 feet of the Anstin City for $40,000; and 600 feet of the Young America for $50,000, besides some of the Atlantic and Lone Star State ledges, but at what figures we are unable to state.

Virginia *Enterprise*, Dec. 27th: H. G. Comstock, after whom the Comstock lead was named, writes as follows from South Pass City, nnder date of Nov. 14th: I am operating somewhat in quartz. I have a fine arastra in operation, and am crushing qnartz from the Miners' Delight. I think this will be a good qnartz camp in another year, as there is a 20-stamp mill going up now and is nearly done. Several mills and arastras are now in operation. I struck the principal surface diggings that have been found here. But little prospecting has been done in this part of the country for fear of the Indians, who have killed several persons and committed many depredations during the summer, but this fall a considerable amount of prospecting will be done.

IDAHO.

Owyhee *Avalanche*, Dec. 19th: At the depth of 140 feet in the Golden Chariot mine, a levol has been run sonth 180 feet, and another level 105 feet north. Along this whole distance of 285 feet, there is not a single pound of refuse rock—it is all pay ore, and that, too, of a high grade. In all the work done on the mine, no vein matter has been rejected; but the whole has been hauled to the mill and reduced. And, as to average results, the mine may safely stand in comparison with any other on the continent. This average—$125 per ton of all the vein matter between the walls of the ledge—is something that no mine in California, or outside of Owyhee, can boast of. While this is the average, mnch of the ore now being taken out is of nnprecedented richness. Many tons together have been worked, and more are in sight along these levels, worth $2,000 and upwards per ton. Four hundred tons of ore are now out, and will be crushed at the New York mill in a few days.

Walsh & Waanke, who have got the John Jacob Astor lode bonded to them until the 1st of June, 1869, have commenced operations. They expect to have 100 tons of ore out by next spring.

Silver City *Tidal Wave*, Dec. 15th: The Earthquake Co., recently formed for mining on the Galena ledge, in Sonth Mountain district, are about to commence work on their mine.

Black's mill is running on Rising Star ore, belonging to the Iowa Co. The mill has been changed to a dry crusher, and is reported to do good work.

The Sinker mill has stopped for the present.

Dec. 18th: A lot of ore, between 50 to 60 tons, came down from the Golden Chariot mine, on Wednesday, which is said to be the richest large lot ever brought down the mountain in one day. The Golden Chariot Co. will have their ore crushed at the Owyhee mill, during the winter.

Dec. 22d: The Pickens & Edward's mine, at a depth of 20 feet, has revealed a solid seam of quartz, in a gouge on the hanging wall, that is nearly metallic silver. This stratum or seam is four inches in width, and increases the mineral vein to a thickness of full two feet.

Black's mill is doing good work on Rising Star ore. The result of the first ton crushed was 37¼ pounds of dry amalgam without cleaning the pan.

The shaft on the Baxter ledge, south of the Poorman, is now down 100 feet, showing a vein of ore 14 inches wide of great richness, and is easily mined. Mr. Herman has shown us a specimen of the ore, showing not only black sulphurets in abundance, but ruby silver in considerable quantities. The principal yield from rock that has been worked, has been in gold. They will continue to sink all wintor, so as to be able to drift and stope in the spring.

The Woodstock mine has been bonded to Dave Meek, who has now out about 125 tons of ore, estimated to be worth $6,000 or $7,000. The ore is to be worked at the Owyhee mill. The prospects for the Woodstock are improving faster than at any previous time in its history.

MONTANA.

Helena *Post*, Dec. 11th: We learn from a gentleman just in from Diamond, that notwithstanding the surface work was stopped by reason of the cold, the miners are preparing to drift and the probability is that there will be few if any idle men in that camp this winter.

A. J. Smith, just in from Bannack, says that camp bears the reputation of being the most bustling camp in the Territory. The surface works having ceased by reason of the cold weather, the owners and miners are turning their attention to drifting, or to the development of their quartz lodes, of which there are some in the vicinity of Bannack that cannot be surpassed in Montana.

The Deer Lodge *Independent* says: Boomerang Gulch is prospecting very richly, paying about $18 per day to each man by the rocking process. The miners of this locality have labored under great disadvantage from want of water, but now having facilities for an adequate supply, the next summer splendid results are looked for from this mining locality.... Carriboo Gulch is deserted for the winter. The Carriboo Co. have erected a large reservoir above their claim and will commence ground sluicing in the spring on an extensive scale. Splendid results are also looked for from this company's operations.

NEVADA.

RUMBOLDT.

Unionville *Register*, Dec. 19th: Ore has been struck in the lower level of the Arizona mine surpassing anything yet found in quality, and abundant in quantity.

REESE RIVER.

Virginia *Enterprise*, Dec. 22d: The White Pine fever continues unabated, though it is somewhat less virulent at present than a month since. Nearly everybody has it in a mild form, and the majority expect to linger in this vicinity until toward spring. Almost daily somebody leaves for the "poor man's paradise," but there is no grand rush. The news from the mines continues unchanged—very favorable all the time.

Silver Bend.—Austin *Reveille*, Dec.

19th: A White Pine has been looking at the mines of this district, and concluded that there was valuable property in that district. He saw considerable piles of ore at all the mines that were worked, the major part of which would pay handsomely; and he believes that the large veins are of the productive and lasting kind. Our correspondent visited the Highbridge, Transylvania and El Dorado north and south, and he says the more closely he examined them the more fully he was impressed with the conviction that they were mines of the highest character. Col. Buel was pushing work with judgment and energy on the Highbridge and Transylvania, and the results obtained were of the most gratifying kind. The El Dorado South appeared to the visitor to be one of the grand mines of the State, and it was evidently well managed. There were two piles of ore at the surface which contained in the aggregate 4 00 tons, the value of which might be safely estimated at $100,000. The width of this large v in has not been ascertained, but it will undoubtedly prove of great magnitude. Several mines of less note, but still very promising, were being worked to advantage and were producing good ore, which the owners may have reduced at Col. Buel's mill, and thus obtain the means for steady development.

Wines & Co's express line from Hamilton brought into this city this morning eight bars of bullion from one of the mills at White Pine.

Mountain *Champion*, Dec. 19th: Troy and Granite districts are receiving much attention. They are both in the range of the White Pine Mountains, from 60 to 80 miles south of Treasure City, in the White Pine district. We are informed that there are from 75 to 100 men engaged in prospecting and locating the many ledges of the Troy district. Now discoveries are made every day and are quickly taken up. The district possesses every facility for the cheap working of its ores—wood and water is plenty, and close at hand. In the Grant district, about 20 miles south of the Troy, many locations have already been made, and there are quite a number of men prospecting in the district. A recent test of ore from the district gave an assay of $351.54 per ton. The veins are said to be large and well defined, and the ore yields a fair proportion of gold. Arrangements are completed for constructing a mill in the district at an early day.

Silver Bend.—Leon & Co., on the El Dorado South are taking out more than at any previous time since the opening of the mine. The hoisting works, and other improvements for the working of the mine, are now completed and they have resumed work on the prospecting shaft, now down 185 ft. The intention is to sink this shaft to the depth of 500 ft. In the old incline the ledge is looking finely and workmen are engaged in breasting out. In the south incline the ledge is increasing in width, and from it they are hoisting large quantities of very rich ore. The Belmont mill is running night and day on ore from this mine, which is yielding from $150 to $350 per ton.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Dec. 27th: The total shipments of bullion from this city and Gold Hill during the past week, has been 6,926 lbs., valued at $167,314.82.

NEW MEXICO.

Santa Fe *Gazette*, Nov. 28th: A correspondent gives a long and interesting account of the discovery and development of the Maxwell quartz mine located near the Cimaron river. He says: When the mill was first started for several days it was fed on different kinds of wall and intermediate rock in order to test their value and see if they would prove worth crushing, but the rock thus experimented upon was found of little value. The mill was then put to work for six days on the rotten and solid quartz and loose earth. I witnessed the result of the clean up of this six days' run and it amounted to 120 ozs. of gold, worth $22 per oz., making for six days' run a total of $2,640, which, after deducting the expenses of $450 for the six days' run, leaves a daily net profit of $365 per day, and a net profit of $109,500 per annum, allowing 65 days' stoppage for cleaning up and other unforeseen causes of delay. The mill is situated in the Ute Mountains, at an altitude of over 7,000 ft. above the sea, and of necessity during some portions of the winter the freezing of the water in the ditch which supplies the mill may cause a sudden and peremptory stoppage of the mill. The situation of the vein is such, that by running in a tunnel several hundred below the present opening the vein will be again struck, and by opening the vein at other points on the lode, an abundant supply of ore for three or four 30-stamp mills, may be easily procured. The deepest opening in any one of the veins now being worked is about 50 ft. and the ore is brought out at an angle of about 30 .

When I first visited Ute Creek and the Moreno mines in September last, Mr. Maxwell was successfully running two hydraulic washers on Ute Creek, and the week's clean up of the sluice boxes amounted to $700, five men being employed. These men are at work on the opposite side of the mountain putting in sluice boxes on the head of Willow Creek so that when spring and abundance of water come some half a dozen hydraulic washers will be ready for profitable washing on Willow and Ute Creek.

Exclusiveness among Scientists.—The following is a portion of the remarks of Prof. Tillman, at the opening of the Polytechnic Branch of the American Institute, on October 10th, touching the subject of "exclusiveness," "aristocracy," and "haughtiness, sometimes engendered by learning,"—in a vein which appears to us to be peculiarly perverted, and narrowly founded, on a very limited observation of the true feelings and habits of scientific men, other than that superficial and vain class of persons who merit, and pretty surely sooner or later encounter, the contempt of both the educated and uneducated of meritorious acquirements: "If there is any hindrance at present to the progress of truth, both here and abroad, it arises chiefly from the spirit of exclusiveness sometimes evinced by those who have devoted their lives to the study of physical laws. This should not excite surprise, because the tendency of abstract science is essentially aristocratic. The man who knows, stands on a higher plane than the one who does not know. Hence, the position of the scientist is impregnable. He has riches and power, of which he cannot be robbed. Should he find his chief enjoyment, however, in the reputation he has acquired, he may well fear rivalry. On the other hand, if he pursues truth for the love of it, he will welcome all who labor in the same spirit, and extend to those below him a helping hand.

The study of natural laws, in the abstract, undoubtedly affords pure enjoyment; yet this feeling is vastly intensified by witnessing their successful application for the accomplishment of new and important results in the useful arts. Such results are often brought about by the artisan who, although he may know but few of these laws, understands most thoroughly all the conditions peculiar to his art, under which they can be effectually applied. Our great inventors have not, generally, had the advantage of a liberal education. By ingenuity alone they take the lead, and, of course, counteract to a certain extent, the haughtiness sometimes engendered by learning."

White Sage.—The Silver City, (I. T.) *Tidal Wave* says one of the most valuable products of that country is the white sage, that abounds along the foot-hills skirting nearly all the valleys. This shrub, or plant, is a small, straight stem, growing in bunches, with white, fuzzy flowers, a white, thick leaf and thick bark, that resembles in taste and consistency the slippery elm of the Atlantic States. It is second only to corn as winter feed for cattle, horses and mules. No section of country in the United States, says our exchange, can boast of as fat beef, during the season, as the region that abounds with white sage along Snake River, and especially in the vicinity of the Bruneau, Catharine and Sinker creeks. These plains, that were, by the early trappers, hunters and emigrants, regarded as an arid and desert waste, have proven the richest winter pasture fields in the world. Prejudice against the artemesia or black sage, that covers so great a portion of the country between the Sierra and Rocky Mountains, prevented investigation and retarded discovery of the virtues of this plant, until the cattle in Nevada brought it into notice and popularity, by persistently refusing the grass fields for sage pasture.

Photographs of the Catacombs.—By means of the electric light, photographs of the Paris Catacombs are now being taken. The apparatus of M. Serrin for the automatic regulation of the carbon electrodes is used. Workmen can now continue their labor as well by night as by day.

Cod Liver Oil—A Substitute.

"Endosmose and Exosmose," are two words used by the doctors to express the capability of transmission or transudation of fluids through tissues. A bladder separating salt water from pure water will not prevent the salty fluid from interchanging with the fresh. There is said to be little doubt that the oil of the liver of fish is more readily absorbed than that from other sources, vegetable or animal. Experiments made some years ago between various oils, including that of Norwegian cod, respecting the degree of transudation, proved the latter to pass moist or dry animal membranes at least five times as rapidly as any other oil. It was also shown as highly probable that this is due to the presence of bile in the liver-oil, since, after removing the bile-constituents by means of subacetate of lead, its coëfficient of transudation was much reduced, and because poppy-seed oil, after the addition of some bile, showed a far higher degree of osmosis.

Dr. Robert Brown recently made a communication to the London *Pharmaceutical Journal*, stating that a fish found in great quantities on the Pacific Coast, and known as the oulachan, or eulachon, furnishes an oil said to be equal to cod liver oil for medicinal effect, while it is devoid of its offensive qualities. From the article in the *Pacific Medical and Surgical Journal*, mentioned above, we extract the following description of the fish:

The oulachan or eulachon, is a small delicate-looking fish, about the size of a smelt, and not unlike it, semipellucid, and with fine scales. On or about the 24th of March—at nearly the same time each year—it enters the northern rivers, and the southern ones a little later. It was once abundant in the Columbia, but that stream being now disturbed by the traffic of steamers, it is only now in exceptional years that they are caught there in any quantity. In Fraser River, and in most of the rivers on the coast of British Columbia, they are still found at that season (March) in greater or smaller quantities; but it is in the Naas River, falling into the Pacific in latitude 54° 40′ N., that the eulachon is found in the greatest quantities, and it is to its capture in that stream that these notes chiefly relate. The fish comes up from the sea into the fresh water for the purpose of spawning, but, unlike most of its allies—the salmon proper—on that coast, returns to the sea again, and is not seen until the following year. During that season they swarm in inconceivable shoals.

The fishing of the oulachan is made an annual festival by the Indians, and they set a very high value on the fish. The oil is obtained by putting the fish into boxes, generally hollowed out of a solid block of cedar, or so closely made as to be watertight, and then throwing in hot stones. The oil is then skimmed off the surface and set aside to cool.

Iron by Electricity.—The production of iron by electricity has been occupying the attention of several experimentalists of France and in Germany for the last few months. The galvanic process may some day give rise to a revolution in our present modes of manufacturing iron. Quite recently, M. Bouillet read a report to the Societe d'Encouragement upon certain electric processes imagined by M. Feuquiers; but the latter gentleman has not thought proper to allow their publication at present. Herr Klein and Dr. Franz Varrentrapp have recently devoted much attention to the production of iron by means of galvanism. In the process of MM. Salmon and Garnier, of Paris, a thin layer of steel is deposited by means of galvanism, upon the copper plate. When it was sought to increase the thickness of the plate thus produced, it was found that the deposited metal was no longer coherent, but easily fell to powder. This circumstance was taken advantage of by Mr. Collas, who applied it to obtain chemically pure iron, which could be easily pulverized in a mortar, and is eagerly sought after for medicinal use, for the manufacture of fireworks, and a variety of other purposes.—*Scientific Review.*

Copper Mining in Michigan, it is stated, employs a capital of $50,000,000, and from 30,000 to 40,000 persons are engaged in working the mineral deposits.

M. Dumesnil's Wine Process.—In this the cask of wine is placed open, under an iron bell and the air exhausted. The gases contained in the wine are thus allowed to expand and release themselves by rupturing the cells enclosing them. The *Chemical News*, in giving an account of the process, says: The theory of the decomposition of grape juice and other organic substances rests on a very elementary fact, viz.: on the power of double decomposition. Gaseous products of the fermentation do not remain inert, but inergetically induce the fermentation or decomposition of free bodies. These products are the most active in inducing decomposition; they alter wine indefinitely when enclosed in the fibrine cells, which M. Pasteur calls mycodermes. White wines owe their great superiority over red wine to their different condition as regards this point. M. Dumesnil gives an example of the practical value of his process. He allowed the wines of 1865 to ferment till March, 1866, so as to allow of the conversion of all the sugar and extractive matter into alcohol. At this period h substituted for the usual operations the treatment by the vacuum; fermentation ceased entirely. The wines thus treated arrived at their destination in good condition; with other samples treated in the usual way the result was very different. Notwithstanding four rackings, and possibly four classifications, the wines continued to ferment during the whole of the year 1866 and also the commencement of 1867, and they probably still contain gases which will affect them more slowly. M. Dumesnil mentions that his wines of 1867, treated in last March by the vacuum, yielded twice as much as those of 1865.

Sea Weeds for Medical Purposes.—The *Journal des Connaissances Medicales*, published a paper by M. Ed. Moride, on a method for applying sea-weeds to medical purposes. The genus *Laminaria* (found on this coast,) chiefly consists of large plants growing abundantly in deep waters or on rocks that only appear at very low ebb. They are very rich in iodine, chlorine, sulphur, silicia, lime, potash and soda. They are burnt in large quantities on the French shores of the British Channel and the Atlantic, and produce the best raw soda, from which iodine is afterwards extracted. M. Moride conceived the idea of turning these plants to account in their natural state, without subjecting them to a combustion which might modify them considerably, and drive off their most useful volatile ingredients. M. Boussingault and M. Humboldt had stated that in America the inhabitants of the Cordilleras of the Andes were in the habit of using the decoctions of sea-weeds, or else their alcoholic tinctures in cases of scrofula, wens, and lympathic tendencies. These liquids are, however, unpalatable, and have, moreover, a strong smell of the original sea-weed; to avoid which, M. Moride proceeds as follows: The plants, gathered on the rocks on which they grow, are slightly rinsed in fresh water, in order to rid them of the salt water adhering to them; then dried and exposed to the sun, whereby they lose their smell and taste of wrack; after which they are pounded in a mortar and macerated in strongly alcholized water at a somewhat high temperature. The iodized tincture thus obtained may be used to prepare a medicinal wine, or else a syrup with, which will be found useful in all affections for which iodine is prescribed.

Soap Growing on Trees.—Soap berries are to be found in immense quantities throughout Alaska. They grow on a bush about the same in appearance as whortleberries. When ripe they are red, of a juicy and quinine taste, and generally biennial. One quart taken and placed in a tub the size of a bushel will, when stirred, completely fill the tub with a froth, and the more it is stirred with the naked hand and arm; the stiffer it becomes, until you can cut it with a knife. It is eaten with horn or wooden spoons, all the family sitting round the tub. It is undoubtedly an acquired taste, but the commodity is much sought for. The froth is of a beautiful pink color. Green berries will make nearly the same amount of froth, but it is of the white color and is not so highly flavored. Foreigners stir it with port or sherry wines, and add sugar, in which case it is a delicious luxury. Large quantities are dried, by being placed in a tub with their leaves, forming a cake, which is placed on wicker tables, with light fires under and the sun overhead. When dried they will keep in a dry place for some years. The dried berries are black and look dirty. A piece two inches square, beaten in a water pool, will fill it full of froth of a dark pink color.

HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
A. S. HOPKINS, No. 70 J street, Sacramento.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:

Saturday Morning, Jan. 2, 1869.

Notices to Correspondents.

VOYAGEUR.—However laudable it may be for a seaman to devote some of his leisure time to assisting any branch of science, in the present state of geology, that science would not be much promoted by a mere collection of rock specimens derived from distant places to which his duties may call him, unless accompanied by detailed observations of the surrounding district. It is now generally conceded that the sedimentary rocks and those usually denominated igneous, are much the same all the world over, so far as lithological structure and appearances are concerned, and a mere fragment unaccompanied by additional information, would only record that single fact. If, however, to such specimens, fossils from the same rock can be procured, highly interesting deductions may be formed.

UNEMPLOYED.—White Pine, from the most accurate accounts which we have received, consists chiefly of chloride of silver combined with some arsenurets of lead, antimony and iron, with some chloride of lead, and possibly subchloride of antimony. As the explorations proceed in depth, it is probable that the proportion of chlorides will diminish, and the arsenurets and sulphurets increase. Should, however, the leads lie horizontally, or at a low angle, the amount of chlorides will probably continue in the same proportion in which they are now found to exist.

MEDICUS.—There are good grounds for presuming that the natives of many parts of central and the coast of Africa, together with some of those inhabiting Islands of the Indian Archipelago, possess a knowledge of narcotic poisons with which we are unacquainted. We have been informed that so complete is this knowledge by some tribes on the African coast, that of two fowls cooked at the same time, they can distinguish whom brought to table the one containing poison from the one that is innocuous.

NATURALIST.—The line of demarkation between the vegetable and animal kingdoms is so obscurely marked in the lower organized marine species, and the modes of collecting and preserving these are so similar, that the methods practiced for either purpose, whether relating to algæ, sponges, corallines, and corals, apply to all.

ARTICLES on the chemical ingredients and practical methods of utilizing California petroleum; on several new ideas for creating power; in a new modification of the German percussion table; describing an ingenious cartridge-making machine; an interesting communication from a mining engineer in the mountains back of Mazatlan; and notices of several lots of minerals received for determination, are, from want of space, necessarily deferred till our next issue.

Improved Method of Working Roasted Gold and Silver Ores in Pans and Barrels by Amalgamation.

The leaching process for which a patent has been issued to G. Kustel, through the agency of the MINING AND SCIENTIFIC PRESS, is applicable to ores from which only a low grade amalgam can be obtained, in consequence of the presence of the base metals—iron, copper, lead, antimony and arsenic. Simple as this process is, it elevates pan and barrel amalgamation to a higher degree of importance.

Millmen are aware of the fact that a certain class of ores, and principally tailings, when amalgamated in pans after roasting, furnish a metal which cannot be melted in a crucible. It consists of metallic iron containing silver, partly alloyed, and partly separated in buttons. Instances of this kind have occurred in the Illinois mill (Nev.) where the proprietors some years ago bought up refractory but rich silver ores, to be worked in pans after roasting. The resulting iron amalgam ruined the purchasers. The old Sutro mill got out hundreds of pounds of iron amalgam from roasted tailings, which, after retorting, had to be dissolved in sulphuric acid, in order to obtain the silver. The same kind of amalgam was obtained also in the Dayton mills, at Dall's mill, etc.

On the other hand, there are a great many mills turning out bullion of from .500 to .700 fineness. The base metals, entering the amalgam, do not only put down the fineness of the bullion, but they actually prevent, to some extent, the complete amalgamation of the silver. These base metals, after roasting, being chlorides, must ordinarily be decomposed before amalgamation, at the expense of quicksilver and of the pan. There are instances where from ten to twelve pounds of mercury was lost to every ton of ore, and where the pans were destroyed in less than a year. The main object of the present process is to remove the base metal chlorides before the ore is subjected to amalgamation.

For this purpose, Mr. Kustel applies a very simple, old process—that of leaching. Most of the chlorides are soluble in hot water, and can be easily removed by lixiviation. An addition of some sulphuric acid is in many instances very useful, but can not be administered if some lead should be present in the ore, in which case muriatic acid is employed; generally, hot water is sufficient. The leaching is carried on as long as a reaction of dissolved metal is perceived in the leach. The ore so treated is then ready for amalgamation. To illustrate the effect of leaching, it may be stated that a charge of 300 pounds of refractory ore from Idaho was equally divided after roasting, one of which was directly amalgamated, the other after leaching. The former amalgamation gave a retorted metal which melted into an untractable lump of iron, while the lixiviated portion yielded a silver bar .897 fine. In both cases the amalgamation was done in the usual manner, under application of heat.

The advantage of leaching the roasted ore before amalgamation, consists, 1st. In obtaining a higher percentage of silver. 2d. In saving from 50 to over 100 per cent. of quicksilver. 3d. In making the pan last several years longer. 4th. In saving the greater part of the copper; and 5th. In a shorter roasting, as there is no necessity of decomposing the chlorides before amalgamation by an increased heat.

The expense, compared with the advantages, is a mere trifle,—the heating of water for leaching. Even cold water will answer, although with a little less effect. Some ores, however, require to be treated first with cold water.

It must be mentioned, that although the chloride of silver is not, like the base metal chlorides, soluble in water, some of it will nevertheless be carried out; but this occurs only at the first attack of the water, when the solution of the undecomposed salt and of the chlorides becomes so concentrated that a little silver chloride is dissolved on the Augustin principle. There is no difficulty practically, however, in preventing the escape of dissolved silver.

Not all the copper contained in the ore is converted by the roasting into chloride of copper, there being also formed a subchloride which is not soluble in water; but this is easily decomposed in the pans, so that in this case a considerable amount of copper would be found in the amalgam. There are several ways of reducing the subchloride of copper, to a greater or less extent, according to circumstances.

It may be mentioned here, that a patent has been granted to Mr. Thomas Rowan, of Glasgow, for a similar application of leaching, which has for its purpose the removing of phosphorus from iron ores before smelting. The ore is subjected to a chloridizing roasting, whereby chloride of phosphorus is formed, which is extracted by lixiviation.

Persons who may interest themselves specially in this process, are referred to Mr. Kustel, box No. 1,588, P. O. San Francisco, for further particulars.

1869.

The New Year begins our XVIIIth Vol. We find those figures suggestive, since they remind us that our era is now old a score of years. Whether our steps in civilization will be measured by scores hereafter, or not; certain it is, from our past, that great results are apt to be brought to pass in the occident in an astonishingly short space of time; and that 1869, especially, will be a year when living, thinking, and energetic men, will not be dreaming. Things are to happen very probably in the course of the year which will be remembered. Our readers need not be reminded of the situation and its varied bearings. It is enough that we here impress upon them the fact that action, and enterprise, are the watchwords of the year; that intelligence is the light whereby development proceeds; and we may congratulate ourselves, as we utter our "Happy New Year," on possessing a field which it will be of some use creditably to fill, as well as a circle of readers in which may be enumerated, not only the hard-fisted men of the crane and hose-pipe, the cabiners and hermits of the foot-hills and of the great interior, but all the wide-awake millmen, mining managers, foundrymen, manufacturers, and scientific men on the Pacific Coast, from the Sierra Madre to Cariboo,—embracing a class more intelligent, select, and of more real importance in contributing to the substantial advancement and development of the coast, than any other journal which is published can boast. Our aim for 1869, shall be to make the MINING AND SCIENTIFIC PRESS indispensable to them, and to those who should, no less than to all who do, patronize us.

THE GREAT BLAST at Smartsville, took place on Wednesday, Dec. 23d, as expected, and proved a complete success. Fifteen tons of powder blew up a body of earth superficially equal to 11,100 square feet and to a depth of 80 feet; making a total of about 888,000 cubic feet of ground raised. There was very little noise, but houses trembled as in an earthquake, from the subterranean concussion, it is presumed. Nothing but a little dust from the gaping crevices was thrown into the air, but the earth rose bodily about fifteen feet, and at once sunk back so nicely into its original position as to retain underground even the smoke from the combustion of the powder. Further details are expected from our correspondent.

THE ANNUAL REPORT of the Empire Mill and Mining Co. has been received, showing clearly and concisely the extent of the operations during the past year.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Railroad Opening Excursion.

The rapid extension of railroads in California is one of the most signal evidences of the great and permanent growth of the State. Their success and popularity already illustrate how much we have been in want of cheap and comfortable transportation on the Pacific Coast.

On Wednesday last, the opening of the Napa Valley and California Pacific Railroad was celebrated by an excursion trip from Sacramento and San Francisco to Calistoga. About 500 citizens from the former place met 700 from this city, at the junction of the two roads, seven miles north of Vallejo. It was a beautiful day, and the excursion was greatly enjoyed—notwithstanding, California-like, "the thing was overdone" by the managers having too many friends who failed to report their acceptance of the invitation, as kindly requested. The cars, and also the dining room at Calistoga, were not only crowded, but literally packed full. The boat left San Francisco at 8 A.M., arrived at Vallejo before ten, and after considerable delay in getting started, as well as at several points on the route, the train reached Calistoga, the terminus, at 2 P.M. A hasty lunch,—furnished by the proprietor of this beautiful resort, Samuel Brannan, Esq.,—was partaken of, when the train returned to San Francisco, the passengers arriving home at about 9 o'clock.

The Napa Valley Railroad, of which Mr. Smith Brown, of Napa, is president, extends thirty-five miles from the junction of the California Pacific, to Calistoga, through one of the most delightful sections of California, as to climate and scenery. The California Pacific Railroad is completed from Vallejo to Sacramento, a distance of sixty miles. It will ere long be continued to Marysville, the company designing to complete a direct line to Oregon, in connection with the California and Oregon Railroad.

Following are the principal stations on the routes passed over by the excursionists on Wednesday: From Sacramento, on the California Pacific Railroad, to Davis, 14 miles; Dixon, 22; Vaca, 30; Fairfield, 40; Bridgeport, 45; Summit, 49; Napa Junction, 53; and Vallejo, 60 miles. From Vallejo to Napa Junction, 7 miles; Suscol, 11; Napa, 16; Oak Knoll, 21; Sebastopol, 26; Oakville, 29; St. Helena, 35; and to Calistoga, 42 miles.

We noticed great improvements going forward along the line of the Napa route, mainly due to the railroad, which presents a fair example of what railroads are yet to accomplish along each important thoroughfare in the State.

The management of the excursion party from San Francisco, by our popular friend Alex. Badlam, was all that could be desired under the circumstances. If space would permit, we should like to speak our mind in praise of D. C. Haskin, the indomitable Superintendent of the C. P. R. R., Mr. Harris, its Chief Engineer; and the landable efforts and opportune assistance rendered by others, in favor of the completion of these projects, the ultimate results of which cannot yet be estimated.

R. D'HEUREUSE, the inventor of the air fermentation and germination process for wines, etc., and of the gold extraction process by zinc, is about to make an extended visit to Europe for the study practically of some of the new inventions which have been made in iron metallurgy—his specialty prior to 1849.

VELOCIPEDES of every variety, including several of new design, are being built at the carriage makers. One at Kimball's has three wheels, two of which measure eight feet in diameter. Rubber tires, and a peculiar treadle-connection by which the full weight of the rider is constantly utilized in propelling the machine, are ideas that find favor. Novelties in this line are also under way at the Golden State Foundry.

THE OVERLAND MONTHLY.—We have received from A. Roman & Co., the publishers, the "Holiday Number" of this magazine, which therewith commences its second volume. It is an excellent number. We have had time to read only a portion of its contents. In "Jonrnalism as a Profession," we recognize an unquestionably first-class article. In the "Outcasts of Poker Flat," we think we see the pen which so graphically described forty-nine life in "The Luck of Roaring Camp." In "Our Brother from California" we can almost fancy we know the "Charlie" whose presence suggested to the (undoubtedly) fair author the subject for the article. The "Etc." contains an excellent letter from Rome, under the head "Gossips from Abroad;" and among the reviews of new books may be especially noticed one of Mr. Parton's "Smoking and Drinking." The whole "Table of Contents" looks tempting, and we promise ourselves a long evening of comfort with it yet.

Read and Subscribe.

With the advantages of past experience, the increased patronage and friendly support of the intelligent and progressive readers of the Pacific States and Territories, we are confident in asserting that the new volume of the MINING AND SCIENTIFIC PRESS, commencing with 1869, shall be in all respects superior to its predecessors. Of the past, we will give the written

OPINION OF OTHERS:

EVERY miner in the community should subscribe for the Mining and Scientific Press.—*Grass Valley Union.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec.* 19.

THE *Mining and Scientific Press* is one of the best papers of the kind ever published, and to California miners, especially, it has become an almost indispensable requisite for the successful prosecution of their calling.—*Nevada Gazette,*

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books *Nevada Gazette.*

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

THE MINING AND SCIENTIFIC PRESS, of this city, has done us the honor to notice us in their columns, and we feel in duty bound to acknowledge the compliment.

It were fruitless for us to say anything in praise of the MINING AND SCIENTIFIC PRESS. * * * It speaks for itself wherever it goes. Its editors are men of intelligence, ability and honor.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

SUBSCRIPTION TERMS, in advance, $5; six months, $3. Specimen Nos. of the paper and Circulars of Information for Inventors, sent free on application.

DEWEY & CO.,

Publishers, Patent Agents and Job Printers, No. 414 Clay st., below Sansome, San Francisco.

A. T. DEWEY. W. B. EWER.

A Hint to Subscribers.

We would remind those of our subscribers whose subscriptions have expired, that we shall be happy to have them forward the amount of their annual subscription. It will save us much time and expense to have patrons send in their subscriptions just before, or promptly at, the time of expiration. We have been unremitting in our efforts during the past volume, to render our paper valuable and acceptable to our readers, and we are sufficiently encouraged with the result to anticipate still greater outlay in the future, in extending the value and usefulness of the PRESS. We hope to receive the subscriptions of many old and new patrons for 1869.

Dec. 24, 1868.

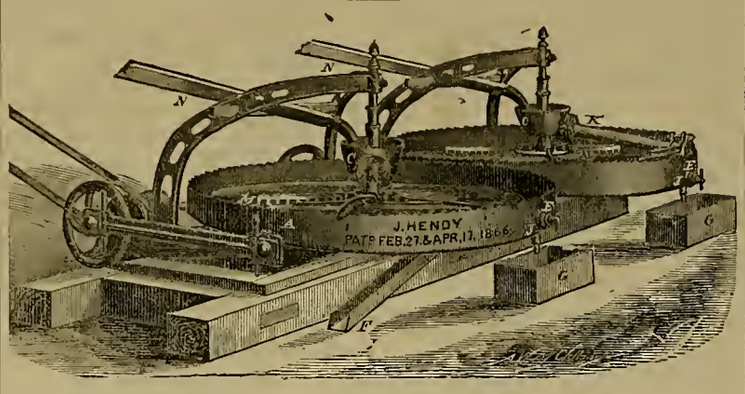
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

J. HENDY, Patentee.

13v17tf

Three Calendars in One.

We have just issued a card circular, of convenient size for the office and counting house use, containing large calendar for 1869 and small calendars for 1868 and 1870; also alphabetical table of distances from San Francisco, U. S. Revenue Stamp Tax, U. S. rates of postage, rates of foreign postage, relative value of currency, information about patents, etc. It is for general circulation, and free for all who may send for it.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number —414 Clay street, below Sansome.

DEWEY & CO.

No Branch Office.

Our friends and patrons will bear in mind that we have no branch office in San Francisco, our U. S. and Foreign Patent Agency rooms being suitably arranged with our MINING AND SCIENTIFIC PRESS printing office, at No. 414 Clay street. We have no partners in business except the undersigned. DEWEY & CO.

A. T. DEWEY. W. B. EWER.

RETURNED.—Dr. J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs beautiful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

Mr. MOWRY, lately a clerk in a hotel at Colfax, is requested to call at the office of the MINING AND SCIENTIFIC PRESS, No. 414 Clay street, below Sansome, San Francisco.

PAIN KILLER.

No article ever attained to such unbounded popularity.—*Salem Observer.*

An article of great merit and virtue.—*Cinn. Nonpareil.*

We can bear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch.*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Penn. Organ.*

It has real merit; as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*

It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.* 26v17-1m

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1849, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y6p

MECHANICAL AND ARCHITECTURAL

Drawing School

—FOR—

APPRENTICES.

MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. 414 CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pumps, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

DR. NESTELL'S
LUNG INSTITUTE,

(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,

For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.

Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.

Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.

Invalids at a distance, on writing their case, can receive the remedies by Express.

Special attendance out of the city will be charged commensurately with the time and distance occupied.

All communications must be addressed to
D. D. T. NESTELL, A. M., M. D.,
Lung Institute,
No. 516 Sutter Street, San Francisco,

Small Pox.

We have been shown by Wm. Zelner, the best and most convenient and portable apparatus containing Chlorine, for rooms, which we consider the best disinfectant out, and should advise all housekeepers not to be without one. Price $1, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 18 Geary street, 25v17-3m

Enterprises and Developments.

SHIP-BUILDING is active at Stockton.

SEVERAL hundred men are making salt on the tide lands of Alameda County.

THERE will be more than 2,000 olive slips set out in San Diego County this year.

FIFTY THOUSAND dollars will be invested in a new distillery at Antioch, Contra Costa County.

A LARGE quantity of salmon has been caught and cured in Humboldt, and forwarded to New York.

THE California Powder Works at Santa Cruz, which have been lying idle for some six weeks, have resumed operations, and lately added considerably to their facilities for manufacture. They have recently put in position a hydraulic cylinder weighing about 7,300 pounds.

THE BRANDY DISTILLERIES.—Samuel Brannan has erected an immense distillery at Calistoga, and purchases all the grapes offered at $1.12½ the cwt. He proposes to make the best brandy of the county, sparing neither cost or pains to do so.

FUNGUS OR "EARS" FOR SOUP IN CHINA. About 30,000 pounds of fungus or "ears" (from its resemblance to the human ear) gathered on trees in the southern part of the Society Islands and packed in bags woven from slips of *booroa* bark, have been discharged from the brig Timandra, for China, where the article commands a good price for soup. The price paid to the gatherers at Tahiti, and at the Sandwich Islands, is 12½ cents a pound.

AT the Summit Soda Springs, a few miles from the Pacific Railroad, a large hotel is to be built in the spring, and the place is to be connected with Lake Taho by a good carriage road. The railroad company have already built a fine wagon road from the station down to the springs. Soda and iron are the ingredients of the waters, which are said to be craved by herds of deer, and to be very salutary for diseased kidneys.

THE Australian Extract of Meat and Cattle Company, with a capital of 100,000*l.*, in shares of 2*l.* 10s. each, has been incorporated in London for the purpose of carrying on in Australia a business similar to that which has been so successfully and profitably established in South America under the auspices of Prof. Liebig. Upon the assumption that 15,000 head of cattle will be slaughtered annually, it is shown that whilst the outlay would not exceed 82,075*l.*, the revenue obtained from tallow, hides, tongues, horns, bones, oil, and extract of meat (the latter taken at nearly 20 per cent. below present prices, to allow for possible, though not probable, fall in price) would amount to 187,500*l.*, leaving a nett profit of 105,425*l.*, or sufficient to return from 100 to 150 per cent. per annum. Two establishments have already been started—one in Queensland, and the other in New South Wales. That Northern Australia is at present unoccupied is attributed to the want of profitable means of disposing of stock.

FISH AND COAL ON THE ALASKAN SHORES. The scientific expedition sent out to Alaska by the Government has made its reports on the fisheries, fur trade and mineral wealth of the new Territory. Much inconvenience was entailed on American fishermen heretofore by their necessary trips to San Francisco, not the smallest part of which was a heavy outlay of capital on ocean-going craft. Now that the country is ours, they can fish in fifty-fathom water in ordinary open boats. Formerly the importation of codfish from New England ports to California was a heavy item. It has been stopped completely by the acquisition of Alaska. In 1867, twenty-seven American vessels were employed among the Shumagin Islands on the shores of Southern Alaska. The average catch was nearly 100 tons, which was valued at 9¼ cents coin, per pound; the average cost of outfit and labor, $3,000 in gold. It is stated that the eastern portion of the Behring's Sea is extremely rich in cod, and that the area within the limits of fifty fathoms depth is 18,000 miles in extent. The banks along the shores of Alaska, south of the Aleutian Islands, are about 4,500 miles. The whale fisheries, especially in Archipelago Alexander, are well known. The Coast Survey has discovered indications of large beds of anthracite coal. The warm current from Japan exercises a beneficial influence on the climate of Alaska.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

SULPHUR TREATMENT OF WINE.—Dr. Frederich Mohr, of Coblentz, does not approve of the use of burnt sulphur or liquid sulphites for improving wine. The sulphurous acid gradually changes to sulphuric, and combines with the potash of the tartar, causing a corresponding quantity of tartaric acid to be set free, and thus to increase the amount of acidity. The effect of sulphur is not permanent, and after the application requires manifold repetition, because the oxidation of the sulphurous acid affects all other oxidizable ingredients far more strongly than before. All the recipes proposed arise from ignorance and the crudest empiricism.—*Druggists' Circular.*

QUARRYING WITH THE AID OF FROST.—The Russians practice a peculiar way of detaching enormous pieces of marble. If powder were used it would destroy the appearance of the marble. The mode adopted is to make crevices in the marble during the summer and fill the crevices with water. As winter approaches the water congeals and causes the crevices to become wider and wider, until finally a huge piece of marble is detached. The quarries present the appearance of an enormous staircase.

GEO. E. ROGERS,
(Successor to G. W. Bell.)
ASSAYER,

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.
A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.
These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.
For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

Professional Cards.
J. S. PHILLIPS,

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer,
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent. less than the established rates. I can furnish improved Quartz Screens as several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me. 5v17-1y

New roofs covered and leaky roofs repaired, in thorough and substantial manner, promptly and at very reasonable rates. Proprietors of Engan's Patent. 19v17tf

AMERICAN

(WALTHAM)

WATCHES,

THE BEST!

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted,

For sale by all first class dealers in the United States and British Provinces.

And in accordance with law, and an order of the Board of Trustees, made on the ninth day of October, A. D. 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at their salesrooms, No. 426, Montgomery street, San Francisco, on the thirtieth day of December, A. D. 1868, at the hour of 4 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. D. SQUIRE, Secretary.

Office, No. 414 Montgomery street, San Francisco. dec5

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the twenty-eighth day of January, 1869, at the same hour and place. By order of the Board of Trustees.

jan2 O. D. SQUIRES, Secretary.

Patrocinu and Dolores Silver Mining Company, Onazapares District, State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of December, 1868, an assessment of two dollars ($2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, C. B. Gifford, N. E. corner of Second and Howard streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth (8th) day of January, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of January, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. B. GIFFORD, Secretary.

Office, N. E. corner of Second and Howard streets, San Francisco. dec12

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of December, 1868, an assessment of seven dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of January, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of February, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, up stairs, San Francisco. d20

Rippon Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, California.

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

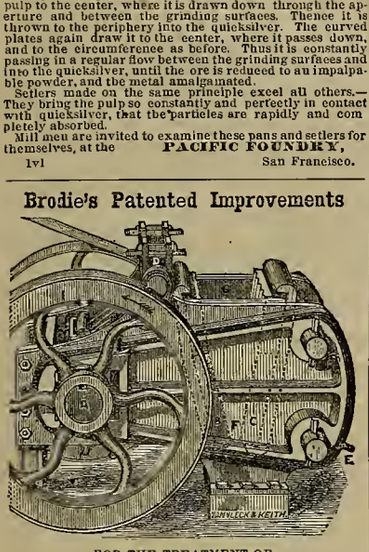
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements



FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... $600

No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforden on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

21v17-qy **J. WEICHHART, Proprietor.**

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION PATENT,

Variety Molding and Planing MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any stop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m

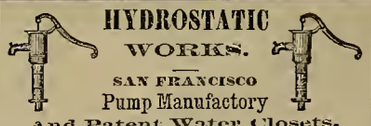
HYDROSTATIC WORKS.



SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair, also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

IMPORTANT TO LUMBERMEN.

ANDERSON'S

Patent Muley Saw Hangings.

These Mulays will cut FIFTY PER CENT. MORE LUMBER PER DAY than any other Mulay in use, with fifty per cent. less power. They are very durable, and easily kept in order, and warranted to give satisfaction. No Mulay Mill should be without them, as they will pay for themselves in a very short time. No other mode of manufacturing Lumber can compete with the Mulay Saw with this improvement. Send for circular. FULLER & CO.,

Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m

Portable Engines.

The Swamscot Co's (warranted equal to any manufactured, may be seen in use in this city), PORTABLE and STATIONARY STEAM FIRE ENGINES, STEAM PUMPS and ROTARY PUMPS, and WOOD WORKING MACHINERY of every description, at Eastern prices. Address W. O. M. BERRY & CO., 511 California street, San Francisco.

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and language; is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send thither, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Monigomery Block. Prompt action is necessary.

DAVID R. SMITH,
Civil and Mechanical Engineer.

San Francisco, November 21st, 1868. 34v17-tf

CHANGES IN HYDRAULIC MINING.—Hydraulic mining, so far as small companies, or a limited amount of capital is concerned, is undergoing a change. Seven or eight years ago the number of companies employed in this branch of mining in Nevada County, was twice, and perhaps three times as large as it is now. Then a hundred or two of dollars was sufficient, in many, if not most cases, to get claims in working order, and to make a beginning. Now the case is more than reversed, and heavy investments of labor and capital are required.

To work shallow diggings a smaller amount of water was necessary, also a less amount of hose and iron pipe. As miners have approached toward the center of gravel hills or ridges, the hanks have become higher, while no more gold can be obtained from a given area of surface. It makes a wonderful difference to the hydraulic miner whether he has to pipe off a hundred square feet of surface with a perpendicular depth of twenty-five feet, or whether to get the same amount of surface he has to wash down from 100 to 200 feet of bank. It necessitates the use of from four to eight times the power to produce as much gold within the same time in the latter case as it did in the former. As nearly all the gold is found on, or within a few feet of the bedrock, the bottom has to be reached before anything like good pay can he found. At Blue Tent, miners have been unable to reach the bedrock yet, and as a consequence the claims there have never paid large dividends. Men with limited means, having deep diggings, must either sell to capitalists or allow their claims to remain unworked. In some instances small claims are being consolidated, or several companies are being merged into one, and by a concentration of capital and labor they are able to extend their mining into deeper gravel. Where fifty inches, and as many feet of pressure were sufficient, five or six times as much water and three times the pressure is now needed. This difference must certainly continue to increase for years to come. Greater hydraulic power, and other agencies more powerful than common powder, will have to he used in order to work successfully. Companies with a capital of from ten, twenty or a hundred thousand dollars will be the rule, and claims worked with less sums will be exceptions.—*Nevada Gazette, Dec. 11th.*

FRENCH LEATHER.—There is no doubt that French leather is the best in the world. It is all tanned,—says the correspondent of the *Chicago Republican*,—in the good old way. The same writer goes on to describe the process, and the points in which it differs from the one employed by American tanners. He says: "The hides are first thrown into a vat of lime water, where they remain until the hair is loosened, then they are taken out, the hair removed, and the hides put to soak in the river to remove the lime. After this they are scraped and carried to vats, where they are covered with 'juice of tan'—that is, water in which tan bark has been soaked, until the solution is as strong as possible. After three or four days, the hides are again removed and scraped, and put into the vats, where the process is achieved. Here we find the first essential difference between the system of America and the French. In America, the hides are put into the vats with a good deal of water – here they are put in and packed firmly in the vats dry. Then, when the vat has been filled up over them with three or four feet of tan, a few pails of 'juice of tan' is poured over, hardly enough to moisten the whole mass.

The hides remain in these vats for at least six months—sometimes two or three years, the longer the better. For first class leather a year is required. Seven to ten per cent a year is added to the value of the leather by resting in the vats up to four years, after which time there is no further motive for letting it remain, as it has absorbed all it can contain of the properties of the tan. After coming out of the vats the leather is scraped, rolled, dried and curried; but all these are operations that have no influence on the durability of the leather, being simply matters of ornamentation and finish. The secret of the excellence of French leather is in these three observances:—1st. Using strong tan, *i. e.*, the bark of *young* trees. 2d. Packing the leather in the vats dry, and wetting the least possible. 3d. Letting the leather stay a long time in the vats.

CEMENT QUARRIES.—On several farms near Benicia, the cement rock furnishing the material for the Benicia Company, is quarried. This is better than many quartz mines, as it always pays $4.50 per ton, dug out and delivered at the cement mill. The Benicia cement business is now an established success.

MECHANICAL TASTE—ENGLISH AND AMERICAN.—The following is part of an article in the *Scientific American:* When a prominent English mechanical periodical chooses to interpolate in a mention of a valuable American invention, favorably noticed, the statement "that what will please an American engineer will not satisfy *our* more refined mechanical tastes," we believe the writer is influenced by his national prejudices rather than by the facts. We are not prepared to acknowledge that the English have more refined mechanical tastes than the Americans, or that English mechanics show more refinement either of taste or workmanship than our own. Indeed, our observation inclines us to a very different opinion. If refinement of mechanical taste has anything to do with grace of form, proper distribution of material, strength without clumsiness, and grace without meretricious ornamentation, we believe American mechanics are not surpassed. In fact, English machinery of every description appears clumsy where it should be only strong, and the material is wasted to make a show of strength where this grand element would exist without this waste. So in the form or shape of the machine or its parts, the show of strength with cumbrousness seems to be considered by English mechanics as better than the reality with grace of form. If this is a refined mechanical taste our English cousins are welcome to it; but where real strength, power, availability, and utility can be united to gracefulness of form and proper proportions, we prefer the sort of mechanical taste that is competent to produce it, and that we believe the works of our American mechanics fully prove they do possess.

SIMPSON DENTAL RUBBER.—The trial of the case involving the question whether the manufacture of the article above named is an infringement of the Goodyear patent, has resulted in favor of the plaintiffs, and an injunction has been issued.

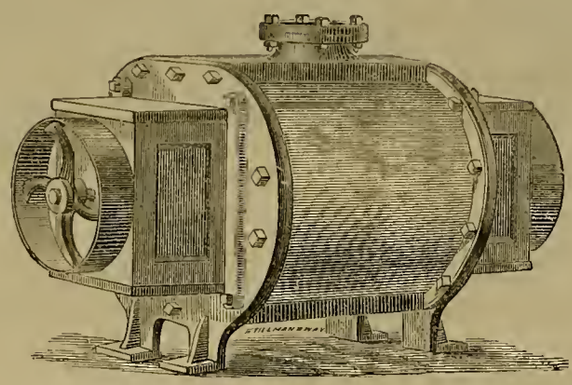
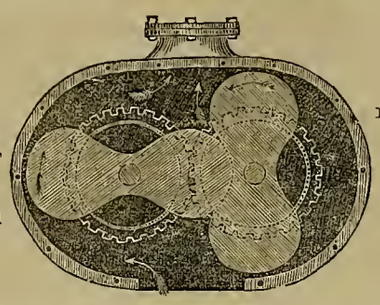
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

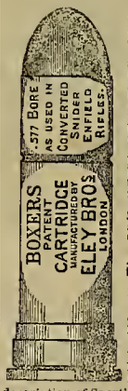
Eley's Ammunition.



These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore
These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.
They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.
Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.
Makers of BOXER CARTRIDGES. .451 bore for Revolving Pistols, in use in Her Majesty's Navy.
PIN CARTRIDGES for Lefaucheux Revolvers of 12 M, 9 M. and 7 M, bore.
CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.
Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.
Wholesale only.
ELEY BROTHERS,
18v16eowly Gray's Inn Road, London, W. C.

Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire
Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.
Address P. O. box 17. 23v17tf

Metallurgy.

LEOPOLD KUH,
Assayer and Metallurgical Chemist,
(Formerly of the U. S. B. Mint, S. F.)
Office, No. 611 Commercial Street, opposite the Mint, San Francisco.
BULLION MELTED AND ASSAYED, THE CORRECTness of which is guaranteed in every respect. All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner. Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs. Ploche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M and R U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

JOHN TAYLOR & CO.
IMPORTERS,
AND DEALERS IN
ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.
512 and 514 Washington Street,
SAN FRANCISCO.
WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior
ASSAY AND BULLION BALANCES,
And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.
A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1865. 11v10-tf

PROF. HENRY WURTZ,
Formerly Chemical Examiner in the U. S. Patent Office, may be employed professionally as a SCIENTIFIC EXPERT, Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,
Who is the Inventor and Patentee of the new and wonderful use of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of
SODIUM AMALGAM.
All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Reburn Pan, for working 1,000 or 20-lb. charges of material for experiments. purposes. 3v17

G. W. STRONG,
ASSAYER AND WORKER OF ORES,
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.

ABOUT PATENTS, Etc.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers, but does not look to point out its incorrectness, unless there be some glaring defect.

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

ADVANTAGES OF OUR AGENCY.

Inventors on the Pacific Coast can sign the papers at once, and save at least two months' time in securing patents. When desirable, they can visit and give us personal explanations—better than written instructions.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

From long experience in the business, and an intelligent and thorough understanding of the objects and peculiar characteristics of California inventions, we are able to present cases more intelligently to the Examiners at Washington than *any other agents*.

We guarantee inventors against losing their cases by delay, or the loss of their money in remitting.

Patents for inventors on this coast are finally secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

We invite consultation in person or by mail. Communications kept inviolately secret, and honest and reliable advice given. Our permanent business interests guarantee, and the thousands on this coast who have consulted us will testify, to our strict compliance with our obligations to inventors.

INFORMATION FOR INVENTORS.

Printed in circular form, containing list of Government and other fees, sent free.

We draw up legal assignments for patentees; record assignments in the Patent Office; procure copies of United States and foreign patents; make examinations here and at Washington regarding the patentability of inventions; take up and prosecute rejected cases, depending upon success for our fees; reissues taken out; interferences prosecuted—in fact, every legitimate branch of the patent agency business is thoroughly conducted by us here and our branch agency in Washington.

DEWEY & CO.,

414 Clay street, below Sansome, San Fraacisco.

United States Postal Rates.

Letters to any part of the United States, 3 cents for each half ounce, or part thereof.

Drop Letters, 2 cents for each half ounce, where there is no delivery by carriers.

Advertised Letters, 1 cent in addition to the regular rates.

Valuable Letters may be registered on application at the office of mailing, and the payment of a registration fee not exceeding 20 cents.

Transient Newspapers, Periodicals, Pamphlets, Blanks, Proof Sheets, Book Manuscripts, and all mailable printed matter (except books), 2 cents for each and every 4 ounces. Double these rates are charged for books.

Unsealed Circulars (to one address), not exceeding 3 in number, 2 cts, and in same proportion for a greater number.

Seeds, Cuttings, Roots, etc., 2 cents for each 4 ounces or less quantity.

All packages of mail matter not charged with letter postage must be so arranged that the same can be conveniently examined by postmasters; if not, letter postage will be charged.

All postage matter for delivery within the United States must be prepaid by stamp (except duly certified letters of soldiers and sailors).

Weekly newspapers (one copy only) sent to actual subscribers within the county where printed and published, FREE. Out of the county, but within the United States, 5 cents per quarter, payable at office of delivery, in advance.

Postal Money Orders, for $20 or less, 10 cents; over $20 to $30, 15 cents; over $30 to $40, 20 cents; over $40 to $50, 25 cents; each additional $50, 25 cents.

The maximum weight of any package of printed or miscellaneous matter is 4 lbs. avoirdupois.

Notices to Correspondents.
Stock Prices—Bid and Asked.
New Incorporations.

MACHINE FOR MAKING THE GIANT POWDER CARTRIDGES.—At Thomas Varney's office, No. 127 First street, may be seen a very serviceable and ingenious machine, whereby much labor and time can be saved in the making of cartridges—of from six to eight inches in length, and from half an inch to an inch in thickness, such as are used in blasting with the Giant Powder. It is an upright tamping or ramrod, which is alternately raised and dropped very rapidly by means of a little revolving wheel, and is so placed that its lower end reaches into a paper cartridge case. The rod is hollow, the powder falling into it from a hopper above, and feeding through it into the cartridge, through an aperture at the bottom which is semi-circular; the other half of the semi-circle being closed and serving as a tamping surface. A motion like that of a revolving stamp, packs the contents evenly. In less than a quarter of a minute, a nicely executed solid cartridge is completed in this manner. It would be very inconvenient indeed, to make cartridges with Giant Powder in the ordinary way, as the material is somewhat sticky. The degree of firmness required in the packing is regulated by tension screws, connected with the support on which the cartridge rests. Hand or steam power may be used.

The Giant Powder Company are extending their operations, finding an increased sale for their powder. At the New Almaden quicksilver mines twenty men are working with it. At Redington's mine, near Clear Lake, it is to be introduced; and numerous mines across the Sierra have been using it to some extent, with a view to testing its comparative economy.

AMERICAN AFFAIRS AND THE PACIFIC RAILROAD IN CHINA.—The new American Minister, Mr. Browne, accompanied by Commissioner Poston and J. Wells Williams, Secretary of Legation and Interpreter, has just presented his credentials at the Chinese Foreign Office, says a Peking correspondent of the last steamer. He was received by Prince Kung, uncle of the Emperor and recognized head of the Government during his minority, assisted by five Councillors of the Empire; and the indications are that cordial relations will be maintained with the Ta-Tsing Empire. Prince Kung inquired with much interest how the Pacific Railroad was progressing.

Collier's Metallic Pressure Piston Packing.

This invention relates to the packing used to render piston-rods or propeller shafts steam and water tight, and has for its object the construction of a metallic packing, which shall be operated upon by the gas, vapor or liquid exerting the pressure, in such a manner as to form a perfectly tight joint. It also consists in so forming the gland of the stuffing box, that it shall serve as a support and guide for the rod and and shaft, and at the same time afford great facility for lubrication.

The query has occurred, probably, to every one, how it is that the engineers can manage to pack piston-rods connecting with the interior of a steam cylinder, so tight, without the extreme friction which would retard the motion of the piston very materially, as to prevent that volatile substance, under its great pressure, from forcing itself out alongside of the sliding rod. Our illustration, with a few words of explanation, will give an idea of how this is done. The large disc (on which the letter A rests) represents merely the left hand end of a steam cylinder, which, if it were represented entire in the drawing, would continue on, of the same dimensions, towards the right. E, E, is the piston-rod, (cut off smoothly at the ends in the model,) which slides through the cylinder's ends; that part to the left of the disc or cylinder's end, between F and D, is the stuffing box, and cage, the former fitting into the latter; and H represents the oiling cup, on the top of the oiling box. F is the end of the cage.

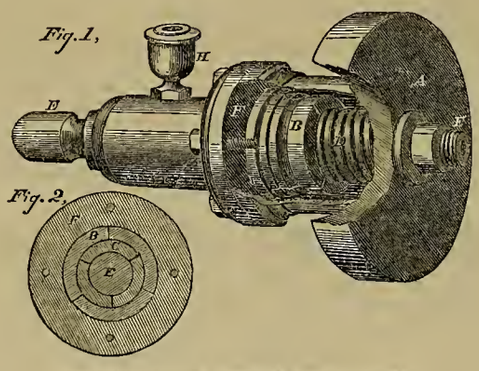
The stuffing box is formed in the ordinary manner, with the exception that instead of entering the cage, the body of the gland projects outward, and forms a support for the rod, and at the same time serves as an attachment for the oil cup, H, which can be easily kept full.

B B are the metallic packing rings, within the cage; each made of three parts or segments and lying over similar rings underneath them, in such a manner as to break joints—as is more clearly represented by B and C in the transverse section below and to the left. It is by their means that the packing is effected so successfully, and without undue friction. The segments are faced to fit the inner end of the gland perfectly tight, and are kept in close contact when the steam or pressure is not on, by a spiral spring D, within the cage.

Two small openings, now, connect the interior of the cage with the source of pressure—as the cylinder in an engine or pump, or the water outside of the ship if it is for a propeller shaft—so that the greater the pressure, the closer are the rings forced against the rod and inner face of the gland.

In any case the packing is to be applied to a water or air pump, so that the pressure will come from the liquid, or the gaseous substance, as the case may be.

One of the most important uses of this packing is in the stuffing boxes of propeller shafts, in which case the openings connect with the outside water, the pressure on the rings depending upon the depth to which the shaft is submerged.



COLLIER'S METALLIC PRESSURE PISTON PACKING.

This device is simple, and not easily got out of repair; is perfectly efficacious and self-regulating, and in the case of shafts, especially, will do away with the great expense of repairing the derangements of the stuffing box which now so frequently occur.

Collier's Patent Metallic Pressure Packing was patented through the MINING AND SCIENTIFIC PRESS AGENCY Oct. 13th, 1868. The principal foundries will furnish the same. Collier's address, for full particulars, is Sacramento City. The inventor is an enterprising young California mechanic, and his invention is one of those matters of operating detail, which are especially worthy of consideration as contributing to the perfection of machinery, and at the same time rendering its use more economical and more permanently lasting.

ST. DOMINGO.—Prof. W. M. Gabb, formerly connected with the California State Geographical Survey, has been appointed State Geologist for St. Domingo, by the Government of that Island. St. Domingo is said to abound in gold placers. Minerals of value are said to be found there in considerable quantities.

Gold Mining and Progress in China.

The working of the Chefoo gold mines has been summarily closed by orders from the different foreign Ministers at Peking, issued to the Consuls, forbiding the issuance of passports, and declaring that "mining" is not a right guaranteed by treaty.

As the Chinamen have the freedom of our own country subterraneously, it would seem that our relations with China are left on an unequal footing in that respect. Ross Browne will, no doubt, talk the matter over with Prince Kung in due time.

An English official, who lately visited the Pengtu fields in the Shantung Province, says he saw a nugget weighing an ounce avoirdupois, and examined several veins, some two inches thick, the general average of which would be about $100 in gold from the working of one ton of earth.

There are said to be three great questions in China just now—the missionary question, the gold question, and the tonnage duty question. Two attachés of the London Mission, have lately returned to Hankow from a tour of 3,000 miles in the extreme Western part of China. They say that they were treated with the utmost courtesy and kindness wherever they journeyed. They found the Roman Catholic converts by the thousand in every village in Sz Chuan, and the crosses literally planted on every hill-side; they also found everywhere traces of coal, iron and other minerals, and proved that, so far as the mass of the people were concerned, the white race would be received with open arms. The ramifications of the ill-feeling existing towards Christianity in some parts may be traced throughout the whole Empire as springing from the same class, the *literati*, who should lead the people towards the true development of China, but who seem to fear that with the advent of foreign ideas the power they now hold will slip from their grasp. A difficulty recently occurred at Yang-Chow near Chinkeang on the Yangtze-Kiang, between a Chinese mob and an English missionary. The mob, headed by the *literati*, destroyed a missionary building and maltreated the inmates, posting placards in the vicinity warning foreigners to leave the Celestial soil under the penalty of death. Three English gunboats went to the rescue, and brought the lax officials to terms.

Baron Richthofen was at last accounts engaged at his geological labors in the province of Shantung. One of the objects of Richthofen's particular attention in China, we understand, is to be the examination of coal mines located suitably somewhere not far from tide water, for shipment of that indispensable material to different parts round the Pacific, especially on our western coast, the work being in the interest of some San Francisco capitalists. The Chinese coal is understood to be of better quality than that of Mt. Diablo and the Gulf of Georgia.

THE stage line between Visalia and White Pine will be opened in February.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The White Pine Mining District—Its Geographical Position, Elevation and Winter Climate.

BY DR. DE GROOT.

Presuming that the readers of the PRESS are tolerably well posted as to the supposed geographical position and altitude of this district, I will merely remark in regard to the same, that, while neither have been instrumentally determined, it is believed to lie in latitude 39° 20′ N., and in longitude 115° 20′ W. from Washington; its altitude varying from 7,000 to 11,000 feet above the level of the sea. Its distance and bearing, taking this place as its center, is from Austin, E. S. E. 120 miles; from Belmont, N. E. 140 miles; from Hico, in the Pahranagat country, and county seat of Lincoln County, N. N. W. 150 miles, and from Elco, the nearest station on the Central Pacific Railroad, S. 115 miles,—as the toll-road now being built to that point will probably run.

With such an altitude the winter climate must necessarily be cold and snowy, though the present season has proved as yet an exception to this rule, at least so far as the depth of snow is concerned; the successive falls that have occurred, some five or six in number, having amounted in the aggregate to less than two feet. But it is well known, that in four or five winters out of six, the snow often accumulates here to a depth of six or seven feet on a level, drifting so badly that it lies in spots until late the next summer. Still, the isothermal lines crossing this region assign to it a milder winter climate than is possessed by places in the same latitude further east; as well also as a milder one than is common to certain sections of country to the west. It is a notable fact that the snow fall is never by any means so great, nor is the cold believed to be so intense at the same altitude on these interior ranges, as on the Sierra Nevada or on the chains lying east of the Rocky Mountains. Still, every intelligent person here counts on much deeper snow and colder weather than any we have yet seen, before the winter is over; while every considerate one will strive to make provision accordingly.

TREASURE HILL—THE SITE OF THE PRINCIPAL MINES—DESCRIPTION OF ORES, ETC.

This district, which consists of an area of twelve square miles, lies near the north end of the White Pine Mountains, a compact and symmetrical chain further south, but which, at this point, is somewhat broken up, being scattered into isolated hills and ridges, some of them running transversely to its longitudinal axis. Upon one of these eminences, named Treasure Hill, the principal mines in the district are situated; the ledges appearing on every side of it, and extending up its slopes, composed for the most part of huge benches of limestone, from base to summit. This hill, which runs north and south, is about five miles long and 3½ miles broad, measured over its summit; its altitude being about 1,600 feet above the encircling valley at its base, and 9,000 feet above the level of the sea. Almost the entire formation is limestone, consisting of stratified dolomite and calcareous schists. The metalliferous lodes are exceedingly variable in inclination, size and strike, standing at all angles, and running towards all points of the compass, while in dimension, they vary from mere stringers of spar and quartz to ore channels having several hundred feet of lateral expansion. In fact, it is but just to say, that the enclosing walls of many of the deposits are extremely eccentric, lacking often the leading features of regular fissure veins. Others again, are well walled, have a readily recognizable dip and strike, conforming in their main features to symmetrical and well-defined lodes; conditions that it is believed will be found to obtain much more generally at greater depths.

The prevailing ores in the better class of mines are composed of green and gray chlorides mixed with horn silver; many powerful veins located mostly about the base of the hill, carrying a large percentage of lead and copper. The locality, however, most abounding in these and similar metals, is a much higher mountain, and its outlying ridges situate contiguous to Treasure Hill on the west, and known as the Pogonip, or Base Metal Range. Here we find a multitude of lodes, of all sizes, the most of them, however, being large and generally marked by more regular features than the majority of those on Treasure Hill. These veins are heavily impregnated with silver, copper and lead, the latter often being present in such quantity as to constitute the ore an argentiferous galena. This mountain and vicinity, abounding in wood, must soon become the seat of extensive smelting operations, as it is by this process that the greater portion of these ores must be reduced. The value of the silver usually found in the ores of the Base Metal Range varies from $30 to $90 to the ton, the value of the lead being from $50 to $70, and that of the copper very considerable. Besides the above metals, the ores of the Pogonip group contain iron, antimony, bismuth, and arsenic, often one or more of them in notable quantity.

LEADING PECULIARITIES OF THE WHITE PINE MINES.

Without going into details, the salient features of the mines here, and those in which their special advantages over all others yet found in this State reside, may be briefly set forth as follows: The obvious abundance, high grade, easy extraction, and tractable character of the ores. From the explorations already made, though comparatively limited, it is now evident that the quantity of ore to be obtained here at small expense, will prove to be large; the crushings heretofore made equally establishing its highly productive and facile character. The cost of raising ores from the principal mines, after the prices of labor and supplies have been made to conform to the standard obtaining elsewhere throughout the State, will not exceed $4 per ton; extensive contracts having already been entered into for their reduction within the next six months at the rate of $25 per ton; a price that it is believed will next summer more than suffice to cover the then prevailing cost of both transportation and milling. That the expense attending the latter can not long exceed those now prevailing at Virginia, may be inferred from the fact, that there is within a distance of five miles from Treasure Hill, a sufficiency of water to supply a milling capacity of 300 or 400 stamps, driven by steam, with wood enough for their use for at least ten or twelve years, while there are additional and much more ample supplies of both a little further off, but still within comparatively easy distance.

Under these circumstances, it will be seen that while the future wants of this district are tolerably well provided for, the better class of mines can be worked with large, certain, and almost immediately accruing profits; such having been the results of all the attempts heretofore made at working these ores.

While we have not the data for ascertaining the exact amount of bullion thus far extracted from the White Pine mines, it may be roughly set down as approximating $1,700,000. The yield of the ore taken out has varied from $120 to $10,000 to the ton; the whole averaging perhaps $600. The cost of extraction has been small, that of hauling and milling having averaged about $70 to the ton, a portion of the ores milled having been sent to Austin, and a good deal to Newark, thirty miles distant, for reduction. In fineness, the bullion has run from .975 to .992, while it is believed that the average standard may by more careful working, be somewhat elevated hereafter. Heading the list of the more largely and actively

PRODUCTIVE MINES,

we have the Eberhardt and Keystone claims, followed by the Staudford, the Aurora-North, the Hidden Treasure,—the three last named a continuation of the same grand deposit, and occupying the crest of Treasure Hill,—with the Indiana, Genessee, Stonewall, Emigrant, Robert Emmet, and several other claims of less note, situate on Chloride Flat, all of which yield nearly the same character of high grade chloride ores, and every one of which could easily be made to turn out from two to ten times as much ore as is now being raised from them. Some considerable lots of ore are also being extracted from a number of valuable lodes as yet but partially opened; such as the Pocotillo, Copper Silver Glance, Charter Oak, Emersley, and the several Hidden Treasure extensions; lesser quantities being gotten out from still others, situate more remote from the leading mines, and generally at much lower levels; the principal among which, are the Cliff, the Featherstone, the Argyle, the Herman, a group known as the Comstock No. 1 and 2, with the Neptune lode lying between them, and, finally, the Mazeppa, a ledge lying three-fourths of a mile south from the Eberhardt mine, and 600 feet below it. In this ledge, the thickness of which has not yet been ascertained, a streak of extremely fine ore has been laid open; causing, mostly on account of its position, a good deal of excitement, and drawing a multitude of miners into the vicinity, where they are now engaged prospecting, not altogether without encouraging results.

There are, of course, a vast number of small veins here that show what are termed good indications, meaning surface streaks of quartz and spar, often mixed with a little ore—almost always conditions precedent to the striking of valuable deposits below; of claims that do not exhibit even these faint tokens of wealth, there are perhaps a still greater number, many persons making locations without surface signs of ore deposits at all, intending to sink shafts and take the chances of striking the latter or running after them with drifts.

CONCLUSIONS.

From the foregoing it will be seen that the likelihood of developing ore channels, of greater or less magnitude, at every point around and upon every level on Treasure Hill, may be considered good. Omitting the older locations of acknowledged wealth, occupying its southerly slope and summit, if, from its top we descend the easterly side of this eminence, we encounter, lying on the same bench with the Eberhardt, but at a point a mile further north, a band of extremely promising claims; chief among which are the Charter Oak, Emersley and the Pocotillo; the latter, now generally regarded here as one of the very best things next to the Eberhardt in the district. Going still a mile further north, and making an additional descent of three or four hundred feet, we arrive at the Virginia mine, in which the genuine chloride ores exist in a massive form; while at a point three miles south, and on a level 500 feet still lower, we have the Mazeppa, the site of a recent rich and significant strike.

Men who have spent many years, some of them holding responsible positions in the mines of South America and Mexico, occupying formations similar to these, speak encouragingly and even confidently of the prospects of White Pine as a prolific and permanent silver-producing district.

Mr. E. B. Dorsey, an authority that few intelligent mining engineers or experts on this coast will question, and who spent many years actively employed in the famed mines of Chañarcillo, Northern Peru, pronounces White Pine similar in all its leading features to that district; the lodes in which, after being worked with the greatest success for nearly forty years, are still producing at depths of more than 1,600 feet, as largely and steadily as when they were first opened. With assurances from such a competent source, and with so many facts before us tending to their substantiation, there would seem to be a good deal of affirmative evidence as to the probable duration and productiveness of the lodes in this district.

Treasure Hill, Lander County, Nevada, December 31st, 1868.

THE CIGAR STEAMSHIP idea of Mr. Winans is not abandoned, as it appears, though the success of the cigar built in London in 1865 was very equivocal, judging from the facility with which it was dismissed from public attention. Mr. Winans expresses his determination, however, to persevere, as he has good practical and scientific reasons to feel assured that his model is the most perfect one for water navigation, as well as to assure entire safety from storms.

THE suggestions found on another page relating to the construction of brick buildings so as to be secure against earthquakes, come from an old architect and builder, and will be found eminently practical and worthy of attention from those who intend actually to build.

The Merced Falls Wood Manufacturing Company have superceded the Chinese help in that establishment by white operatives, male and female.

Engineering.

A RAILROAD mania has fairly commenced in Oregon.

THE grand canal of China is being surveyed by Capt. Dunlop, of the British steamer Dove.

THE levee from Woodbridge to the crossing on the Mokelumne River has been completed.

A HYDROGRAPHICAL department has been organized for the Chinese Coast, the object being mainly to erect lighthouses.

EVERY department of the Sacramento Valley Railroad Company's works is in active operation.

THE engineers of the Saucelito and Humboldt Railroad Company, were in Santa Rosa recently, engaged in looking out for the best place to cross Santa Rosa Creek.

THE astronomical and triangulation work of the Pacific Coast Survey will be done by Prof. Davidson, while the hydrographical work will be under A. F. Rogers.

RUSSIAN ENGINEERS SENT TO AMERICA. The Emperor of Russia has sent to this country two civil engineers, with instructions to make a complete examination of the operations of the Pacific and other great railways in the United States. The Emperor contemplates building a railroad from China across Asia to the capital of Russia.

THE SURVEYING PARTY, marking out the California and Oregon boundary line, have just been paid off, and several have quit, not wishing to make the trip to the coast this winter, which renders it doubtful if it will be attempted before next season. The coast mountains and passes will be exceedingly difficult to pass, unless the winter proves a very mild one.—*Yreka Union, Dec. 4th.*

TRIAL OF A CHEAP RAIL.—The iron used in constructing the Presidio Railroad is of a new pattern, being simply a plain flat rail, something like the old "strap rail," or "ribbon rail," bent so as to hollow it like a section of tin-eave trough, or the half of the bark of a small tree. This is laid on or over a parallel wooden rail, with the concave side down, and answers the purpose, where only light loads are to be carried, admirably.

OUR report of the proceedings of the N. Y. Society of Practical Engineering, being on the subject of "Modern Improvements in Mining," is placed this week under the head of miscellaneous, though it contains several interesting facts about ancient turbines, which are used in the Orient, and about our river flutter-wheel, used for raising water out of river claims, being identical with Persian wheels of remote antiquity on the Nile, and on the Ganges.

ROAD MAKING.—The *Railway Times* says the common practice in this country, in road making, is wasteful and expensive. The upper soil is removed, and coarse gravel or broken stone supplied to bring up the grade, and the road is then left to be worn down smooth by passing teams and carriages. A waste of power is thus involved, an immense and useless wear of vehicles, loss of time and a great amount of general discomfort. Drainage is seldom thought of, and during the wet seasons, and especially when the frost is coming out of the ground, the roads are nearly impassable. The common remedy for all this is to pile on more gravel or broken stone, and then again commences the destruction of wheels. This useless tax to the owners of horses and vehicles could nearly all be prevented if the roads were properly made, drained and cared for. Proper drainage is the first essential; then the road dressed with gravel or stone should be formed and rolled into proper form to shed water—a very slight incline to either side is all that is necessary—and then you have a road that is easy to horses, and the load is carried with half the power that is expended in hauling over very many of the roads in our suburban towns. Less gravel or broken stone, but more care that it is kept in place and smooth, is what is required. In England and France they are using powerful steam rollers with good results.

Mechanical.

THE CORNISH PUMPING ENGINE.—W. H. G. West, 1st Assistant Engineer, U. S. Navy, sends an article to the *Journal of the Franklin Institute*, from which we extract the following:

"The real causes of the success of the Cornish pumping engine are so simple, that only men of very practical minds discover and appreciate them; and this simple machine remains a mystery even to those who have made its manufacture their principal occupation.

The simplest and cheapest way to pump water, is to force some perfectly smooth substance, without appreciable pores, into the body of water, so that the water may rise a correspondiag amount and flow away. Here we have no friction, no leaks, and, therefore, no loss of efficiency. All the power is utilized. When we add a casing or working barrel with packing, we add friction; when we add valves, we add the work of forcing them open; when we add reciving and delivery pipes, we add friction; when we add turns, we add obstructions; when we contract the pipes or valves, we add thousands of smaller obstructions, and increase the friction, as the square of the speed of the water through the pipes must increase; and when the valves are lifted, they take time to get down again, and water must leak back.

Cornish pumps, well designed, have large pipes. Cornish pumps are packed with soft, elastic hemp packing, or the best substitute at hand, and the cup of the gland is kept full of some fluid lubricating matter.

The valves or clacks of the Cornish pumps are made of large diameter and small lift; they shut quickly, and the leak back through them is correspondingly small. The stroke of the plunger is always long, and the times of leaking back are thereby lessened. There is but one turn in the Cornish pumps—that from the plunger-case to the column."

THE "MOSS-RUBBER" INKING-ROLLER.—A roller which, according to the *Mechanics' Magazine* is destined to supersede that in ordinary use with printers, is the invention of Stephen Moulton, of Bradford, and is thus prepared: "The inventor takes the ordinary vulcanized india-rubber, and reduces it to powder. He then places it in a mold, and subjects it to a second vulcanizing heat, which converts it into a homogeneous mossy substance. It is then covered with a skin of rubber and sulphur, and again subjected to a vulcanizing heat in order to cure the rubber skin, after which the roller is ready for use. The result of this process is an article composed of a homogeneous material of the consistency of moss, which is hermetically sealed in a smooth skin of india-rubber. The advantages possessed by these rollers are important to the printing trade; they are very durable, on account of the unchangeable character of the material; they are unaffected by temperature; are not damaged by use on brass rule; are permanently soft and elastic; seldom require washing, and when washed for change of color are ready for use immediately."

A NINETY-TON CASTING IN THREE HOURS. One of the large blocks of iron to be employed by the Russian Government for fortification purposes, was recently cast at Krupp's iron works, at Essen,—says a Berlin letter,—in three hours and forty-five seconds. The fraction is for the actual time occupied in the casting,—the melting having been done in three hours. In England, the casting of a steam hammer, weighing one hundred tons, requires forty-eight hours.

These large blocks or plates are moved by a hydraulic crane, and with perfect ease. They will not be fastened together, with bolts and screws, but will be made to dovetail into each other. They are to be used in connection with earth embankments.

A YANKEE MACHINE IN ENGLAND.—F. Watkins went to England in 1856 to sell his patent machine for making bolts and nuts. He gave it up after several attempts, and commenced the manufacture of those articles on a small scale. In two years he had all he could do. His works have extended until they now cover twenty-four acres of ground in Birmingham, and employ twenty-five hundred hands. He makes one hundred tons of bolts and nuts per day.

DAMASCUS STEEL.—The Indian damask is made at Lucknow. All the workmen are Persians, one of the manufacturers being known from antiquity. His name is Mirza Hussein Chirazi. The damask consists of three parts silicate of iron, one part cast iron, and two parts very pure iron. These substances are put in crucibles which contain five to forty *miskals* (25 to 200 grams.); the latter are then set in a furnace and kept therein for six days at a strong heat. Such furnaces are made to contain from 10,000 to 12,000 crucibles. When the metal is solidified they are broken to pieces, the iron being brought in an annealing oven and kept therein for forty-eight hours, where it is left to cool slowly. If this precaution is neglected the damask becomes brittle as glass and useless. The damask of Kaswine is made in the same way, but instead of common iron the heads of old horseshoe nails are taken. The damask of Khorassan is superior to those already mentioned. Since the supremacy of Nader-Chah, who destroyed all its ovens, it is no longer manufactured. The damask of Arsindgan, Neres, and Schiras, is sold for an equal weight of gold, there being very little in existence, as all the furnaces of those places have been destroyed long ago and never rebuilt. The damask of Khorassan possesses dark designs and is very brilliant. That of Kaswine possesses a gold-like reflex. The designs are intertwisted, presenting in general a series of circles. The armorers buy the damask, the quality of which they know from long experience. For the purpose of testing it they heat, for instance, a piece to red heat and forgo it then to a length of one foot and a half. If scintillation takes place it is considered of a bad quality, and also when the surface does not present a perfect evenness.

COMPRESSED LEATHER.—The *Iron Age* says that a substance under this name is now made by reducing to a fibrous mass the cuttings of hides and shoemaker's waste, and mixing them with water containing one per cent. of sulphuric acid, until the whole becomes a plastic mass, which is then pressed into molds of the desired size and shape. After drying by steam, it is pressed through rolls glazed on one side and roughened on the other, to produce the grain and flesh sides of the leather. About one pound of glycerine to the hundred weight is added, to render the leather flexible. For many purposes, as for soles and heels of shoes, etc., it is equal to natural leather, and can be sold at one half the cost.

NEW ELECTRIC LAMP.—The London *Mechanics' Magazine* describes a new lamp, exhibited by Mr. John Browning, F.R.A.S., at a recent meeting of the British Association,—which is to be worked by a Grove's battery of only six cells, and is intended for the use of photographers in printing transparencies. In it, the carbon points instead of being pulled a short distance apart, are allowed to touch each other, and are fastened in that position, so that the current has to burn a space between them for itself. A mechanical arrangement causes the contact to be renewed as soon as the wasting away of the points breaks the communication. The electric light is destined to supersede both gas light and the lime light for photographic purposes.

PRECAUTION IN ARRANGEMENT OF MACHINERY.—The *American Artisan*, in an article deprecating the fool-hardy neglect of the most ordinary safeguards against accidents from machinery in motion, which one so often sees, mentions the following instance which came under the notice of the writer: A naked belt running in a horizontal position was arranged at the inner side of a stairway so narrow that two persons could not ascend it abreast, yet men passed up and down these steps many times a day, with the certainty that if an arm touched the edges of the rapidly-moving belt, vein and tendon would be severed as by the contact of a band-saw. This, however, was not all; for the outer side of the stairway had no hand-rail, and should a person lose his balance, in a startled effort to escape if touched by the belt just mentioned, he would be almost certain to fall upon the upper edges of another belt working in vertical planes, and arranged near the outer or open side of the stairway.

Scientific Miscellany.

THE FLORIDA SHELL-HEAPS.—Dr. Jeffries Wyman, who has visited the shell-mounds of East Florida, describes them in the *American Naturalist* as varying in size from circular heaps fifteen or twenty feet in diameter, and a few inches high, to long ridges several hundred feet in length, and having a hight from a few inches to four or five feet; in some cases being as high as *fifteen* feet. They are composed almost exclusively of some three species of shells, the *Ampullaria depressa*, *Paludina multilineata*, and *Unio Buckleyi*. They are distributed over a distance of more than 150 miles. They are generally overgrown with oaks, maples, palmettos, bays, magnolias, etc.; and in several cases with groves of the wild orange, a tree which was probably introduced by the Spaniards. They are unquestionably of human origin. Fragments of pottery, of the bones of various edible animals, and in some cases charcoal with half-formed shells, were found at different depths. Ornaments of bone were found in some of the mounds, and in one a piece of "chipped" flint.

The conclusion arrived at, after careful inspection of dead oak trees lying upon the tops of some of these mounds, and which must have sprouted, grown, died and fallen, since the completion of the mounds upon which they lie, is that this completion must be referred, as regards its epoch, to a point at least a century before the discovery of the continent, and perhaps much earlier.

WONDERS OF THE MICROSCOPE.—The following is an extract from a lecture upon "The Microscope and its Revelations," delivered on Nov. 25th, before the American Institute, by President Barnard, of Columbia College, New York: "Suppose a little drop of water, such as might be lifted upon the point of a pencil; within this insignificant space may be easily contained, of some of the smaller organisms, a number not less than two thousand millions—that is to say, more than double the number of the human inhabitants of the entire earth. Even this will fail to convey an adequate idea of the extreme minuteness of the objects we are considering; for such numbers as millions and thousands of millions are totally inconceivable by the mind. The names are mere sounds, which serve us for symbols in making computations, but to which it is impossible to attach any clear notions. Let us try another illustration. Draughtsmen, and persons who have occasion to make use of divided rules, are aware that a division finer than about 150 to the inch is with difficulty discerned. Few eyes will distinguish lines closer than 200 to the inch. Divisions so fine as 1,000 to the inch defy the keenest vision to separate them at all. A cube, therefore, having its sides only equal to the one-thousandth part of inch, is an object invisible to the unaided human eye. But such a cube is large enough to hold not less than 2,000 of the minuter monads."

METEORS AND STONE SHOWERS.—The remarkable meteor of Oct. 7th, which was seen both in England and France, is described by the journals of both as illuminating the earth for some seconds with a bluish electrical light so powerful as to completely overpower the moon, which was shining brightly at the time. *Le Petit Journal*, of Paris, says that in a conversation between one of its contributors and M. Chapelas-Coulvier-Gravier, a celebrated French observer, the latter gave it as his opinion that meteors and the showers of stones which have so frequently been said to accompany or to follow them, are, contrary to the generally received belief, entirely distinct phenomena.

PLATINUM IN VINEGAR MAKING.—Artus, in his *Vierteljahresschrift*, recommends to dissolve one-half ounce of dry *bichloride of platinum* in five pounds *alcohol*, saturate therewith three pounds of wood charcoal, broken to the size of a hazel-nut, and ignite in a covered crucible; and to use the product in the well-known way in the oxidation of alcohol to acetic acid. He states its action to be surprisingly rapid and complete, and that the vinegar obtained has a pleasant flavor and odor. This seems an improvement of sufficient practical promise to be worthy of record.—*Prof. Wurtz.*

SALT AND RADICAL.—Thos. Wood, F. C. S., writes the *Chemical News*, suggesting new definitions for these words. At present the term salt is very vaguely used, and not easily understood by learners. Chemists, even, are unable to state clearly, briefly and concisely what they mean by the word:

Mr. Wood defines a radical to be any body that, without itself suffering decomposition is capable of entering into chemical combination with another.

Further, radicals are either simple or compound, real or imaginary. Simple radicals are the elements; compound radicals are such bodies as Cy, etc.; and imaginary radicals, as SO^1, NO^1, etc., are those which have never been isolated, and, like atoms, only exist in the mind and imagination of the chemist, created for his own use and convenience, but rendering the acquirement of the science by the young much more difficult than it would be without them.

If these views of a radical be correct, a salt will be any compound formed by the union of two or more radicals, and will take its characteristic place and name from the radicals composing it. From this definition it would result that a compound radical is already a salt. If, however, a compound be capable of uniting with another, or taking part in a chemical equation without itself suffering decomposition, it should receive the name radical, compound radical, or salt radical, to distinguish it from a true salt.

Thus HCl, HNO^3, and H^2, SO^4, are true salts composed each of more than one radical. If these bodies are salts with a sour taste, let us teach that they are such, and not that they are a special class of chemical compounds capable of generating salts; for radicals, not acids and bases, are the bodies of which salts are composed.

EARTHQUAKES.—At a recent meeting of the Polytechnic Branch of the American Institute, in New York, Dr. J. J. Edwards read a paper upon this subject, which is thus reported: He argued that the earth is kept in its parts by the reciprocation of attraction and repulsion; that the earth is not a molten mass in its interior, although it may once have been; that the heat of the earth is not sufficient to account for earthquakes, nor for the phenomena which are necessary for the vegetable and animal life on its surface; that the laws which govern the sun and the planets are universal laws, and that to know the laws of one is to know approximately the laws of the whole, and that the differences are only of degree and variety, and not fundamental; that a meteor or aërolite is a planet, and, consequently, its component parts indicate the structure of the earth; that the sun is the fountain of our motion and life; that heat, light and electricity are solar emanations, directly or indirectly; that the new scientific laws of the correlations of forces and the conservation of forces are the key to the cause of earthquakes; that the earth stores up any superabundance of heat or light in their correlation to electricity, and that earthquakes are caused by the discharge of this superabundant electricity in its endeavors to equalize itself over the earth or to discharge itself into the surrounding atmosphere under the same laws as the Leyden jar. The lecturer concluded by stating that inasmuch as the greater part of the paper was composed of quotations from others he was not responsible for them, though he heartily concurred in them, believing electricity to be the cause of earthquakes.

GALVANIC ACTION OF COPPER-BOTTOMED SHIPS IN DOCK.—Some month since, the "Elk," a new English screw gunboat, was placed in the old shipping-basin at Portsmouth dockyard, where she lay ten weeks waiting for her screws. When these were ready, it was found that galvanic action had actually reduced the key pieces on the shaftings to plumbago, and had honeycombed other parts of the metal. The *Chemical News* says that "the fact appears to be that the small area of water in the old ship-basin is but seldom opened to the admission of the tide, has always three or four copper-bottomed vessels floating upon it, and is therefore a chemical bath."

Work at the Foundries.

Beginning with the foundries at the farther end of Beale street, on Thursday, we found that Hawkins & Cantrell are at present engaged on a number of wood manufacturing machines for Elam & Howes, whose establishment was burned down in December. Several steam engines are also in hand. A Voris shingle-cutting machine, capable of cutting 40,000 shingles a day—one of the best machines of the kind invented—has just been shipped for Soquel in Santa Cruz county, and another one like it is being made for the same place. Considerable work has been done by this firm lately for the California Fuse Company. This foundry has been in operation since April last, and is now occupied at all kinds of work. Mr. Hawkins has been manager of different works, having been formerly connected with Booth, Dinsmore & Co.

There are two tool manufacturing establishments on this street—Weichart's, and Hinz's—which turn out superior work, but only to order, as it would be impossible to compete with hardware dealers in miscellaneous wares, while blacksmith's wages are from $3 to $4 a day. The works of Weichart will he remembered from the fine glove-cutting tool exhibited hy him at the late Fair, and those of Hinz, by samples of his superior molding tools, with which he supplies the wood manufacturing establishments of San Francisco.

Llewellyn & Co., of the Colnmbia Foundry, are engaged, not extensively just at present, at house castings.

Thompson Brothers, of the Eureka Foundry, have several important johs on hand. One of these is the making of castings for a gas holder for the city of Mazatlan, which will weigh 13,200 pounds—not to mention other attachments of a gas making establishment. Mr. Howell, a resident of Mexico for 20 years, has been here to see to this work, at the same time he is getting the necessary iron work for a water company which is to supply Mazatlan with water, and looking into the matter of atreet railroads. The improved grate hars manufactnred by the Thompson Brothers, whereby Mt. Diablo coal and screenings may he hurned, have met with a steady demand. Castings of every description are made a specialty of at these works. They have heen in operation aince April last; the brothers having heen formerly connected with Brodie's, and with the Pacific Iron Works.

Stoddart's are making a "tumhling beam engine" for a small propeller. Several of these have already been tnrned out here. They are said to possess great advantages.

At Lochhead's there ia heing made, for a tow-boat, for Mr. Mastick, the largest propeller engine ever undertaken in California, having a 36-inch cylinder. A novel arrangement of double engines, for double propellers, is being made for Goodal & Nelson of Santa Cruz, to run across the har there, and up Salinas river. The advantage of and necessity for this douhle propeller, is that they are enabled hy it to navigate at aea, across a trouhlsome bar, and up an intricate stream, with a draught of only aeven feet of water.

At the Lincoln Iron Works, engines priucipally are being made. A fine one for a steamboat propeller is just completed.

The Risdon Boiler Works seem not inactive, hut report nothing of interest on haud at present.

Coal in Northern California.—It is reported that some deposits of excellent coal have been found near the big bend of the Pitt River, 50 miles from Fort Crook.

The Galaxy.—This representative of the present living and rising literary lights of New York, has commenced on its seventh volume, with a great array of familiar names as its list of contributors.

The Folsom Foundry is doing a large business.

[Written for the Mining and Scientific Press.]

Particulars of the Smartsville Blast.

Editors Mining and Scientific Press: On Tuesday evening last the drifting in the Smartsville Consolidated Hydraulic Mining Company's claims, where 1,201 kegs of powder were to be exploded, was completed; when the drifting or total tunneling was measured, sbowing 570 feet in lengtb, by 2½ in width and 3½ in hight. Tbe powder was then placed in the different cross-drifts, the bead taken out of each keg, the kegs heing stowed so as to break joints, and distrihuted in quantity, in proportion to the higbt of the hill to be operated upon. Mr. T. D. Field, of San Francisco, whose services were secured for the occasion, entered the drifts, arranged the wires, placing cartridges in each of tbe cross-drifts, in such a manner as to ignite the wbole mass at twelve different points at the same instant. Seventy feet of the main drift was then tamped; which was completed by 11 o'clock A. M. on Thursday. The wires were then laid to a point 600 feet distant, selected for the hattery.

The quantity of powder to be exploded in this hlast, and the effects to he anticipated, had heen a theme of conversation and speculation by the people of the surrounding country for some time, many contending that life and property would he endangered; and it was publicly announced some time before, that on Thursday at 12 o'clock, the blast would be fired. The whole neighborhood was on the move.

Families in tbe immediate vicinity could he seen with tbeir little ones climbing over the mountain for safety. On the top of the most prominent hills could he seen groups of people anxiously waiting, whilst others, to show their bravery, remained within two and tbree hundred feet. The hour of 12 baving arrived, all baving been ready for an hour past, Mr. Field charged the battery and gave the word, when Miss Angie Crary drew the cut-off, and as quick as lightning could travel 600 feet, the hill was seen to raise some fifteen feet, open in a thousand places, and then settled back a pulverized mass, without making any report, there being only a slight tremhling of the earth, and all was over. The space blown up was 270 feet in length, 180 feet in width, with an average depth of over 100 feet, supposed to amount to 200,000 tons of gravel and cement, which was tbus prepared for washing.

The cost of this hlast is near $6,000, and it will require 150 days full running time to wash it off. The water for the same at 600 inchea per day, and fifteen cents per inch, will cost $12,000. The cost of cuts and flumes, etc., preparatory to washing, is about $20,000. You may judge from these items what it costs to commence, or what it requires to place a hydraulic mine in order to commence work.

There are several mines here that are in successful operation, and four very expensive bedrock tunnels are being run within a distance of a mile, to strike the old river channel, now being worked by the Blue Gravel Mining Company, some account of which I will send you for next week. A.

Smartsville, Jan. 4th, 1869.

The Imperial Silver Quarries Company.—A correspondent from Boise City, I. T., inquiring about the Imperial Silver Quarries Company, says: "This Company, I learn by an English paper (John Bull) of 8th August last, was, during the previous week, wound up under the "Company's winding up act," before Vice Chancellor Malins, who animadverted very severely on the conduct of the Directors, and notified them that they would be held for the liabilities of the concern in their individual capacity."

It seems, nevertheless, that the Company is doing something in Alpiue county; though on what basis, or to what extent they are tunneling, we are unable to state.

Low Grade Ores.—On rock averaging only $6 to $7 to the ton, the Golden Rule Mining Company is declaring bi-monthly dividends of 2½ per cent. on the capital stock. The company will carry over from this dishnrsement a surplus of $12,000, which is at interest in bank.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

For the Week Ending December 15th.

84,858.—Improvement in Churns.—James Carlton, of Walla Walla, Washington Territory:

I claim in combination with the partially cogged-gear wbeels F, F, and hollow pinion H, the agitator composed of the hollow spindle J, bollow arms b, h, and floats a, a, substantially as and for the purpose herein described.

The object of this invention is to provide an improved device for converting cream into butter, and is what the inventor terms a *reaction* churn. It consists in so arranging the driving gear that the agitators will be moved once around and back alternately, producing a reaction that will quickly convert the cream into hutter. It also presents a new feature in the construction of the agitators, as the shafts and arms whicb unite them are hollow, and communicate witb the air outside through the shaft and pinion by which they are driven, tbus distributing tbe air through the body of the milk or cream.

84,877.—Improved Tile for Floors, Sidewalks, etc.—John Gray, of San Francisco, Cal.:

I claim the above described composition tile as a new article of manufacture.

This is a composition which when molded and pressed into blocks or slabs will be suitable for sidewalks, floors and all kinds of paving, where a smooth surface or floor is desired. When properly prepared it will be dry and hard like stone, and can he furnished at a small cost as compared with stone or marble.

84,914.—Improvement in Automatic Stop-cock for Gas Burners.—Geo. E. Smith, of San Francisco, Cal.:

1. I claim the compensating curh or rod, composed of two or more metals b and c, together with the lever K, detent M, arm D, and spring E, substantially as and for the purpose described.

2. The lever K, connected with the curh, the two detents G and M, and the catcb a, on the arm D, constructed and operated substantially as herein described.

The frequency of accidents resultiug from carelessness and iguorance of the use of gas, has induced tbe inventor to provide a small attachment to gaa hurners, which is operated automatically, and will, in case tbe light is hlown out or becomes extingnished by any means, shut off the flow and thus prevent the fatalities frequently consequent on the room becoming filled with gas, and also prevents the waste of gas which is often considerable on this account. This device is especially applicable in houses where the gas is left burning all night without any attendant to watcb it. It consists of a hoop supported at such a hight as to encircle the blaze at a little distance from it. The hoop is composed of an outer rim of brass and an inner rim of steel riveted together and fixed at one end. The other end moves from oue side to the other, operating by the unequal expansion of the metals, and thus moves the arm of a lever which connects with a delicate holding catch or detent. By this the stop-cock is kept open as long as the gas burns and the heat is kept up, but whenever the flame is extinguished, the contracting hoop operates the lever and throngh it on the detent, freeing the arm of tho stop-cock, aud allowing it to close, which it does by a spring.

84,963.—Improved Railway Car Brake. D. J. Parmele, of San Francisco, Cal., assignor to himself aud J. H. Currier, of Springfield, Ill.:

I claim the combination with the lever e, of the booked rod g, hooked trigger i, and cord k, provided with rings, substantially as and for the purpose described.

85,005.—Improvement in the Preparation of Sulphates and the Manufacture of Fine Silver Therefrom.—Frederic Gutzkom, of San Francisco, Cal.:

I claim the preparation of crystals, consisting principally of sulphate of silver, by separating them from tbeir solution in a sulphuric acid in the manner as described above the volume, tbe specific gravity and the temperature of such acid to be withiu the limits as stated in my specification for the purpose of converting such crystals into wbat is called commerce fine silver.

85,008.—Improved Carriage Spring.—Frank A. Huntington, of San Francisco, Cal.:

I claim the rigid levers C, C, and springs G, G, in combination with the adjustable bars F, F, the whole arranged substantially in the manner and for tbe purposes described.

The object of tbis invention is to provide an improved carriage spring so constructed that a weight placed on any part of tbe carriage will depress the spriugs on each side equally creating no undue strain to any portion, and so arranged and applied as to give the carriage the greatest elasticity without impairing its strength, and it consists in using separate springs or levers for each end of tbe buggy, one end of which is pivoted to a clip which is attached to the center of the body on each side, the opposite ends being secured hy a shackle to a curved picce of metal attached to tbe holster and axle bed. A bar passes from the springs on one side, to the springs on the other, a short distance from and on each side of the clip connection, and springs or bumpers made of india rubber or other elastic materials is placed ou each end of these cross pieces.

"The White Pine News" is a newcomer, just horn to the journalistic world. It is a neatly gotten-up paper, especially remarkable for the largo amount of valuable and ably prepared information it contains about White Pine district, local and general—making it equal, indeed, to a little volume on the subject. To give an idea of the matter, there are beadings about White Pine prices; winter immigration and work; the altitude of Treasure Hill; water supply; road repairs needed; description of various mines; reports of discoveries, shootings, etc. Amongst the longer articles we fiud descriptions of the geography, climate, of Chloride Flat, notices of outside districts, mention of huilding materials, and an article canvassing tbe prospects in general, besides a "list of letters remaining," etc. Pitchford & Simpson, are tbo publishers, at Treasure City. The able assistance of Dr. De Groot is evidenced in the editorial preparations.

Wharf Construction.—John A. Fulton, the builder of some of the most extensive wharves in this city, has just completed a fine piece of work at the foot of East street, between Jackson, for Thomas & Twing, wood and coal dealers—the Commissioner having permitted them to so use the property as a wharf, on condition that they would pile and cap it, which has heen done. Capt. Roberts has also been constructing wharves along the outside of the new hulkhead, where considerable activity may be witnessed in pile-driving, etc.

Nelson Chesman, No. 40 Park Row, New York, will puhlish this month a hook of 300 pages, containing a list of all newspapers and periodicals published in the United States, Canadas and British and North American Provinces. We believe it will he the first publication of the kind published in this country. More particulars concerning this work will be found in our advertising columns.

Packard's "Guide to the Study of Insects."—We have received from the author Part IV of this valuable work. Agriculturists and horticulturists, who are constantly brought in contact with insects, some of which are friends and others enemies, ought to learn to distinguish between them; and for such the work is espccially intended. The work is issued from the press of the Essex Institute at Salem, Massachusetts.

California Invention Sold.—The parent right for Bussey's Combiuation Safe Lock for the Pacific Coast, was sold on Saturday last for $5,000, to Kittredge & Leavitt, of this city. The purchasers are well versed in bank locks, and are sure of having made a fortunate purcbase, having observed the steady advance of the Bussey Lock in popular favor.

Weekly Stock Circular.

By Associated Brokers of the S F. Stock and Exchange Board.

San Francisco, January 9, 1869.

Financial.

We are experiencing a season of financial abundance, with fair prospects of continued ease for some time to come. Expenditures for the holidays were unusually large, throwing a great deal of loose money into the market, and stimulating a lively trade in various articles, many of which were of home manufacture.

Our laboring classes evince a strong desire to accumulate, as is sufficiently proved by the constantly increasing deposits in the Savings and Loan Banks. At this season, these institutions, and our local corporations, are making their accustomed dividends, thereby placing considerable amounts in active circulation. Rates in bank remain steady at 1@1¼ per cent. per month. In several instances large sums have been obtained at 10 per cent. per annum on first class real estate mortgages. We quote gold bars at 860@870, and silver bars from par to ¼ per cent. premium; currency bills on Atlantic cities command 33¼ per cent. premium on gold; sight drafts, payable in coin, 1 per cent. premium; telegraphic transfers, 1¼ per cent. premium; sterling exchange, 48¼@49d.; commercial exchange, 49¼@49½d. Mexican dollars, 5@6 per cent premium. Bullion is in fair supply with good requirement.

The steamer Great Republic sailed for Yokohama on the 4th inst. with $753,294 in treasure, divided as follows: For China, $58,525 in gold bars; $282,362 in Mexican dollars; $198,539 in silver bars; $25,413 in gold coin, and $6,860 in gold dust. For Japan, $63,156 in gold bars, and $118,437 in silver bars.

Transactions in real estate have not been very active since the middle of October, but are regaining tone and strength. The number of sales in December was 484, being an increase of 78 over November. The amount of money involved in the December sales was $1,606,759. There were 221 mortgages effected in the same month, representing $739,915, and 143 releases, amounting to $312,222. Those who own eligible lands in the city manifest a disposition to keep them, and decline putting them in the market. Carter's *Real Estate Circular* says that the Montgomery street extension will be pushed through without delay, but not on the line formerly contemplated. The extension will run parallel with Second street, and be wider than the present Montgomery street. A large portion of the property involved has already been purchased for $706,220 extending on a line of 1,100 feet, being at the rate of $642 per front foot. The Cosmopolitan Hotel, together with the fifty-vara lot on which it stands, was recently sold for $375,000. Two years ago it was offered to a wealthy capitalist in this city, together with the furniture, which was then new and valued at $140,000, for the sum of $320,000. After some hesitation the offer was declined.

Lands are in request in nearly all portions of the State, and improvements are upon a corresponding scale.

The amount of coinage at the Branch Mint, for December, was $2,422,000, of which only $82,000 was in silver. The total coinage for 1868 was $17,400,000, being $2,698,535 less than in 1867.

The Twelfth District Court dissolved the incorporation known as the Builders' Insurance Co., on account of its insolvent condition, the assets standing at $91,084 27 against $136,681 65 liabilities. We understand, however, that their marine risks have been taken by the Home Mutual Insurance Co., and their approved fire risks, to the amount of about $6,000,000, by the Liverpool and London and Globe Insurance Company.

City Stocks.

Since our last similar reference, transactions embraced under this head have not been large. We note sales of Spring Valley Water stock at $66, and San Francisco Gas at $80 25 per share.

The dividends of our Savings Institutions for the six months closing with December, have been nearly all announced. We annex the rates of each: Savings and Loan, 10 per cent. per annum, free of Federal tax, payable on and after the 11th inst. Odd Fellows, 12 per cent. per annum, free of Federal tax, payable on and after the 12th. San Francisco Savings Union, 9½ per cent. on ordinary, and 11 2-5 per cent. on term deposits, free of Federal tax, payable on the 12th inst. Farmers' and Mechanics', 10 per cent. per annum. German, 9½ per cent. per annum on ordinary, and 11 2-5 per cent. on term deposits, payable on and after the 15th instant.

The Spring Valley Water Co. pays its usual monthly dividend to-day. The Pacific Insurance Co. declared a quarterly dividend of $3 per share, the Occidental the same amount, and the Merchants' Mutual Marine its usual monthly dividend of 1 per cent., all payable on the 11th instant.

Mining Share Market.

Within the past few days the mining share market exhibited a very fair degree of vitality. Savage, Yellow Jacket, Overman, and Hale & Norcross, being leading stocks in the market, the sales of the same have been quite heavy, partaking largely of a speculative character, and at the close showing a slight recession under this movement.

ALPHA—sold at $52 50@59 50, then at $56, and closed at $54. On the 5th inst. the incline was 114 feet in depth below the 940 level.

CHOLLAR-POTOSI—opened at $169, declined to $158, and at the close realized $168. The bullion receipts for the month of December foot up $108,336; in November they amounted to $102,722, and in October to $112,898. During the week ending January 1st, they extracted only 520 tons of ore against 1,261 the previous week. Nothing of importance from the mine.

CROWN POINT—ruled at $52 50@$56, then sold at $53 50, and closed at $53. It is believed that the stopes on the 850 level will not hold out much longer than six weeks. The shaft, on the 3d inst., had been carried to a depth of 1,091 feet, sinking continuing in hard rock. The south drift was in 330 feet from the south boundary line of the Kentuck company. The divergence of the clay walls found in this mine, it is thought, would give some confidence in finding a new ore deposit between the face of the drift and the north line of the Belcher company.

CONFIDENCE—sold at $36@37, and closed at $37. The bullion returns for December show a yield of $14,728; in November they were $13,983, and in October $22,832....GOULD & CURRY ruled at $98@119, and at the close sold at $113 50. During the months of October and November the bullion returns amounted to $14,603.

HALE & NORCROSS—has been quite active at fluctuating rates, advancing from $44 50 to $50, then selling at $46 50, rising to $64, and closing at $55 50. The bullion receipts in December aggregate $10,875, in November $16,013, and in October $26,641.

IMPERIAL—improved from $110 to $116, then sold at $112, and closed at $109 50. On the 5th inst. they commenced to drift from the bottom of the winze—35 feet below the 900 level—the water having increased so much that they could not sink any deeper. In December the bullion returns aggregated $44,288, in November $35,944, and in October $58,229.

KENTUCK—declined from $263 to $245, advanced to $254, closing at $251 50. A dividend of $20 per share is payable to-day. The bullion returns for December foot up $98,582; in November they amounted to $86,097, and in October to $69,145.....OVERMAN exhibited increased activity, selling at $88@92, then at $80 50@85, and closing at $82. The bullion yield in December amounted to $60,258, against $34,000 in November, and $35,000 in October.

SAVAGE—has been in marked request, improving from $81 to $87 50, declining to $83, and closing at $83 50. A dividend of $4 per share—aggregating $64,000—will be paid on and after the 11th inst. The bullion returns in December reached $152,000; in November, $119,760; and in October, $128,000.....YELLOW JACKET jumped from $1,460 to $1,630, fell to $1,450, and closed at $1,480. A dividend of $100 per share will be disbursed on the 15th inst. Owing to the reticence of officials at Virginia, we are unable to give any monthly bullion statistics.....SIERRA NEVADA shows a bullion yield of $7,568 during the month of December. The assessment levied in November has been rescinded.

AMADOR (Cal.)—was in the market at $240@250. The receipts of bullion in December amounted to $46,000.....EUREKA (Cal.) shows a bullion yield of $70,910 during the month of December.....JULIA levied an assessment of $2 50 per share on the 6th inst.

A USEFUL PUBLICATION.—The MINING AND SCIENTIFIC PRESS, published at San Francisco by Dewey & Co., is a publication valuable to all classes and indispensable to miners and inventors—the patents for nearly all California inventions having been secured through the Patent Agency of the proprietors of that paper, and the inventions themselves brought into notice through its columns. We are glad to learn, from Mr. Wm. H. Murray, the traveling agent of the paper, who dropped in upon us Monday evening, that its merits are so well appreciated; and we unhesitatingly commend both the paper and its gentlemanly agent to the confidence and patronage of scientific and practical men of all classes and every occupation.—*Solano Herald.*

WHITE PINE WATER SUPPLY.—A. W. Von Schmidt, the engineer who planned and superintended the construction of the Spring Valley Water Works, has made arrangements to supply Hamilton from springs three miles distant, which discharge regularly 300 inches of excellent water.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

ELKO, ten or fifteen miles from Maggie Creek, and near Humboldt Cañon, is the starting point of another wagon road to White Pine.

DATA of value and importance to those interested in White Pine, prospectively, will be found in an able article by Dr. De Groot, on another page.

NEW SUGAR REFINERY.—The corner stone of a new sugar refinery, at the corner of Eighth and Brannan streets, has been laid.

LUMBER at White Pine sells at $175 and $200 per thousand.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

HALF WAY up Lookout Mountain, the place where memory is stirred by a thousand recollections and associations, and where the brave boys of both armies met and fought hand to hand, where the blood of both friend and foe was mingled together and ran down the mountain-side in rivulets, is a smooth-faced rock, upon which a poor, wounded soldier inscribed the following:

"S. T.—1860—X.—Early in the battle I was wounded, and carried to this spot by two clever "Yanks." They bade me farewell, and, as they supposed, to die, for I was so weak from loss of blood that I could not faintly thank them for their kindness. They left in my canteen part of a bottle of PLANTATION BITTERS, to which I owe my life, for it strengthened me, and kept life within me until help came and my wound was dressed. God bless them for their kindness and for the PLANTATION BITTERS.

HENRY DAVAGEL,
Company B, 10th Ga.

AUSTRALIAN KANGAROO.—Five of these beautiful animals, embracing three different species, one of which is exceedingly rare, have made their appearance at Woodward's Gardens during the past week. They are as fresh and lively as when taken from their native haunts.

C. MULLER, oculist, 205 Montgomery street, deals in all kinds of spectacles. If you cannot apply in person, you can be fitted by sending description, age, etc.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Dec. 26th: A strike has lately been made in the old Billy Rodgers claim in Hope Valley which promises to be of importance to Alpine. The croppings exhibit copper, and the early shallow workings were only successful in getting pretty good copper ore.

On Monday last Supt. Gamble started up the new hoisting works of the Morning Star Co., and is pushing ahead with the work in the shaft, and expects to be about 50 days in going down 80 ft. further, at which depth he will commence a drift to strike the body of ore in the lower level.

Chronicle, Dec. 26th: Good ore has been struck in Barnes' claim, known as the old Billy Rodgers claim, in Hope Valley. The shaft is now down about 110 ft. The contractors will drift north and south on the ledge and get out all the ore they can between this time and next spring, when Mr. Barnes will erect a mill.

AMADOR COUNTY.

Jackson *Ledger*, Dec. 26th: W. H. Thoss has sold his Sulphurets mill and property connected therewith situated on Else's Creek, near Volcano, and the right to work the rebellious ores for the precious metals by the "Thoss process," to Ed. Schultz, of San Francisco, for $11,000 cash. The "Thoss process" is warranted to extract and save at least 90 per cent. of the precious metal from the ores worked, at a cost not to exceed $7 per ton, and has been used very successfully by Mr. Thoss, the inventor, for several years.

Mr. Schultz has purchased valuable mining property at Pine Grove, and will work the rock by this process. He has erected splendid hoisting works at his mine, and is now adding a battery of five stamps to the sulphurets mill.

Jan. 2d: During the past seven months, there has been worked at the sulphuret furnace of Coney & Bigelow, at this place, 304 tons of sulphurets, taken from the following mines: Coney & Bigelow, 180 tons; Dunnings, 3½; Atchison's, ¾; Keystone, 24; Oneida, 93; El Dorado County, 3. These sulphurets average $120 per ton, yielding in the aggregate, $36,480. The richest are those taken from the Coney & Bigelow mine. The cost of working the sulphurets does not exceed $16 per ton.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, Jan. 2d: It is the intention of David McCarty, of Railroad Flat, to erect a custom quartz mill in that locality. New discoveries in quartz are being made in that vicinity almost daily, and additional facilities for crushing the rock have become necessary. Labor will be immediately commenced upon the new mill.

We were shown, this week, by John Asbury, some very rich specimens of gold-bearing quartz. The rock was taken from a lead recently discovered by that gentleman near Railroad Flat. The lode has not been sufficiently developed to determine its extent, but its richness shows for itself.

No mining locality in the county is attracting so much attention or improving so rapidly as Railroad Flat. Business of every description is lively; new buildings are being erected; strangers attracted by the intelligence of rich strikes, are flocking in; shafts are going down, quartz mills being erected, and, best of all, gold coming out.

The Whisky Slide correspondent writes: The Sheep Ranch is getting to be quite a mining town. There are at present three water-power arastra mills, with more quartz ahead than they can crush in the next six months. The following are some of the successful mines in the district; the McNare mine has a shaft 70 ft. deep, from which they have taken a large quantity of rock out, that estimated at $30 per ton. Smith & Ferguson have a well-defined mine; they think it will pay $50 per ton, from present appearances. Smith & Co., proprietors of the Lodi mine, crushed 25 tons of rock that paid $1,700. Hicks & Co. have out about 25 tons of rock that will pay $60 per ton, and a well-defined lead. Smiler & Co. are running a tunnel on their lead, with a prospect of having one of the best mines in the district....Dennis Burns has bought the Collins claim at Chee Chee Flat, for $460.

MARIPOSA COUNTY.

Mail, Dec. 25th: The Washington mill, near Quartzsburg, has been in successful operation for several months past, crushing rock from the old Washington mine.

Same, Jan. 1st: The Buckingham Mountain Co. after a 10 days' run of their new mill, made a cleaning up of their batteries, on Monday last. Considering the difficulties which usually attend the working of a new mill, the yield of amalgam was quite satisfactory to the company. They intend grinding 100 tons of ore on the next run, which will pay upwards of $20 per ton.

Work on the Hite & Co. mine has been temporarily suspended, owing to the large quantity of ore already out and uncrushed at the mill.

The old Benton mill will be started in operation to-day. The new mill will start in a few days. A large amount of rich ore has already accumulated at the mills and mines, sufficient to run the mills for two months or more. The constant and increasing yield from the Pine Tree and Josephine mines, will require additional machinery, which will be furnished in a short time. An early resumption of work on the Mariposa mine is also anticipated, and further developments forwarded as fast as possible.

NEVADA COUNTY.

Transcript, Dec. 20th: The storms of this winter have as yet done the mines little or no good. Nearly all the water that has fallen has been absorbed by the ground, and it will require another seven days' rain to satisfy the miners.

The Schofield Gold Quartz Mining Co. have obtained a United States patent to the mine. This claim contains 985 feet, and is located in Grass Valley district.

Reasoner Bros. & Co. have located 800 feet on a quartz ledge, on Portuguese Ravine, below the South Fork ditch, near Graniteville. They have named it the Savage mine.

Dec. 27th: The Eastern Co. have located 3,000 feet on Secret Hill, in Remington Hill district, Little York township, for mining purposes. The claims commence at Steep Hollow Creek, adjoining Swift & Sure's ground, and fronting 1,500 feet on Steep Hollow.

Dec. 31st: The Knx Klnx Mining Co. have located 1,000 feet on a quartz ledge in the bed of Wolf Creek. The ledge is one mile south of Grass Valley, and ¼ of a mile from Larrimer's mill.

Gazette, Dec. 28th: The Badger Hill and Cherokee companies have begun hydraulicing for the winter. The Chalk Mountain Blue Gravel Co., at Burrington Hill, near the Cascades, will commence hydraulicing on Thursday next. From their ditch, leading to their claims, they have recently constructed 1,000 feet of flume, four feet wide, two feet deep, with an 8-inch grade. They have five drops to their flume, the first being 150 feet; second, 60; third, 65; fourth, 50; fifth, 20; total, 285 feet. They employ 30 men. The same company, in their Chalk Mountain tunnel, at the Cascades, are taking out gravel that yields $4 to the pan. The Red Diamond Co., below the Chalk Mountain Blue Gravel Co., are still drifting in their tunnel and taking out good pay. They are in about 400 feet.

Dec. 29th: The Buckeye Gravel Co., on Rock Creek, have struck very rich gravel in their claims on the extension of the old Nebraska lead. The pay gravel is from 40 to 60 feet wide, and averages about four feet in depth. The gravel is taken out and washed in sluices, and will pay from $60 to $100 for each set of timbers, the latter being four feet apart. The Kansas Mining Co., ¼ mile below the Buckeye Co., are vigorously at work on their gravel claims, sinking a double incline shaft. They are now down nearly 200 feet, and expect to strike the lead at a depth of between 500 and 600 feet.

Dec. 31st: Several intercsts in mining ground near French Corral, have been sold during the past month, and a number of agents for San Francisco and eastern capitalists are negotiating for the purchase of mines in that vicinity. Stidger, Evans & Co., of the Buckeye claims, have given bonds to sell their ground to an English Co. for the sum of $225,000. Several other claims have been bargained for within a few days past, involving a large amount of money. A number of these mines, a few years ago, were considered as valueless, or worked out, and now their owners hold them at from $10,000 to $50,000 each.

Jan. 1st: Water has now fallen in sufficient quantities to enable miners to fairly commence operations with the prospect of continuing them through the winter. We believe that the usual amount of preparation has been made, and the rains, coming thus late, have given miners a chance to have everything in readiness. The storms, while giving water enough to supply the ditches, have not done them any damage, as is frequently the case at this season of the year. From present appearances, hydraulic mining will be carried on as generally and successfully throughout the county this season as last season.

Grass Valley *Union*, Dec. 31st: We have chronicled several new strikes within the last month, and all of these have proved good ledges. The owners are working on all of these for the gold which comes out of them. We notice great activity among prospectors. Ben. McCauley's mill, at Boston Ravine, is kept constantly running on custom work, furnished, for the most part, by prospecting companies. Of all the different crushings made recently at that mill, not one has failed to pay over expenses of mining, and in many instances very heavy pay has been had. There is a hope that Massachusetts Hill and the Scadden Flat claims will be worked during the coming year, and an almost certainty that Allison Ranch will start up early in the spring.

Jan. 1st: The Seven-Thirty mine, on the head of Squirrel Creek, has been noted for sometime as a good paying ledge. The rock has averaged not less than $60 to the ton, by mill process, and excluding the sulphurets, which are supposed to be very rich. The Bowery is on the extension of the Seven-Thirty, and has produced some fine rock. A crushing of 16 loads from the Bowery, yielded, $2,541, or $158.81¼ per load of about one ton weight.

Grass Valley *National*, Dec. 30th: We saw yesterday evening at Findley's bank, a little button of gold worth $105, which came from 1,400 pounds of sulphurets taken from the top rock of the Higgins ledge, which is now being so successfully worked by Frank Morse. These sulphurets pay at the rate of $150 per ton, and were worked by Hobart & Burr.

Dec. 31st: We saw to-day at Delano's bank, a lump of gold worth $2,541, the product of 16 loads of rock from the Bowery ledge, an extension of the famous Seven-Thirty. The shafts of the two mines are only 550 feet apart. The Bowery is now running an incline, and has advanced 72 feet. None of the rock which gave this handsome yield of more than $158 to the ton, came from a point more than this distance from the surface.

The last crushing of ore from the Osborne Hill mine, consisting of 60 loads from the north side, yielded $1,900, and rock is now being crushed from the south side that pays $65 to the load.

PLUMAS COUNTY.

Quincy *National*, Dec. 19th: Richards, Jenkin & Co. on the Wah-pon-see Hill, have their ditch finished, hydraulic planted, and all in condition to drive the gravel down the slope, and pick up the gold nuggets as they have them from prospecting evidences. John Colman, on the head of *Quein Sabe* Ravine, has likewise opened a splendid prospect, in a relic of the Blue lead. McVey & Taylor, at the Mountain House, No. 2, are all ready, and anxiously awaiting a change in the elements. Good diggings they have to a certainty. All the boys around the Mountain House district would very much like a week or two's rain for their especial benefit, as well as the boys around Brandy Flat, who have made extensive improvements the last three months, so as to work their diggings more extensively, and longer in the water season, having plenty of good paying ground. There are a good many more mining camps around Silver Creek district, that are paying diggings when they can get the gravel to run through their boxes. The Badger Hill, Gopher Hill, and Curtis Point invincibles, are all waiting to run a little more gravel down the hill.

SACRAMENTO COUNTY.

Folsom *Telegraph*, Dec. 26th: The late storm has closed river mining for the season. John Wild & Co., in their claim below the bridge at Mormon Island, on the South Fork, have done well in their claim this season. This claim is near the celebrated old Watson claim of "49" memory.

W. H. Knox is now working in his claim at Coon Hill, near the Western House, in this county, 15 hands and expects to roll out a large amount of gold dust at his next wash up.

Clifford & Co. are opening a large and extensive claim in the next hill adjoining the renowned Willow Spring Hill, on the southwest, with excellent prospects, and there is every reason to believe they have a valuable claim.

SAN BERNARDINO COUNTY.

Guardian, Dec. 26th: We were just shown a specimen of pure gold, weighing 7½ ozs. taken recently from the Ames' claim on Lytle Creek.

SHASTA COUNTY.

A Millville correspondent writes the Red Bluff *Independent* as follows: A great effort is being made to establish hydraulic mining on a large scale in this county. D. E. Gibbons, of Alameda, and Rodman Gibbons, of San Francisco, are the prime movers in the affair. Their diggings at Piety Hill are of the most extensive character.

TUOLUMNE COUNTY.

Sonora *Democrat*, Jan. 2d: Hamilton, Lucas & Lander have relocated the old Ripperdam claim, near Pap William's Ranch, and are about to commence operations. They intend running a race up through the flat with the hope of striking a rich shute in a quartz vein at the head of the flat, in which a rich shute had been found some years ago. The gravel in the flat prospects well and will doubtless pay good wages.

Thos. Burns has purchased the Foundry & Jackson mill, on Big Creek, and is about to add new machinery to it. He intends using it to crush rock from a new mine recently discovered, in the vicinity of Big Creek, by James Burns. The mine is well prospected and no doubts are entertained of its paying. Ten tons of rock from it, crushed at the Garrote mill, paid $19 per ton.

Some Chilenos had made a rich strike at Coyne's Ranch, on French Gulch, near Murphy's, a few days before our visit. On the 22d ult., they picked up between $400 and $500, one piece weighing over seven ounces.

The hydraulic claim of A. M. Mitchell, at Vallecito, looks remarkably well, and the Doctor informed us that a small pit which had just been cleaned up, yielded over $4,000. There are many other good claims on Vallecito Flat.

TRINITY COUNTY.

Weaverville *Journal*, Dec. 26th: The Trinity-Center correspondent writes: New mining operations are being commenced here, with good prospects. Crocker & Co. and McLean have new claims which will pay well. Several new claims have been located on a line with Boyston & Whitmore's and Tom Coyle's, which will be opened early in the spring. James Murray has sold his claim to a Chinese company, and gone to San Francisco.

ARIZONA.

Prescott *Miner*, Dec. 12th: From J. A. Anderson, who has been tunneling in the Chase mine, we learn that the tunnel is now in about 215 ft., the ledge about three ft. wide, the sulphurets plenty and rich. Water is plenty and causes a great deal of trouble.

Chas. Borger is working quietly at the Sterling mine. Mill and furnace are now going. The last run paid well. We saw, the other day, some beautiful gold bars from the Sterling, which, we are told, were worth about $500. Our ores are now being tested by the chlorination process and should they turn out as well as intelligent miners expect them to, the pine mountains of Arizona will be the liveliest mining camp on the Pacific coast.

The owners of the Plantanca lode are going down on it slowly. The ore is improving and the water increasing. The vein is about three feet wide, running north and south. They have struck the vein at five different points in a space of about 400 feet and at each point they have found good ore as soon as they reached the water level.

Graves & Co., and French & Curtis are working away at the head of Lynx Creek, in the Walker district. Mr. Griffin has just completed a furnace for Fleury, Graves & Co., and milling and desulphurizing will soon commence.

Mr. Cory, who came from Wickenburg last week brought with him, from the Vulture mill, the richest piece of rock we have seen in a long time. The Vulture and Smith and Wickenburg mills are grinding away night and day, and there is not an idle man in town.

Jackson Bros., Capt. Shoupe and others are preparing to work their hydraulic claims, on Lower Lynx Creek, eight miles east of Prescott.

The various companies that own claims in Big Bug, are preparing to work them, and a week hence, some 15 men will be at work in the district.

In Mohave and Yuma counties, quartz and placer mining is being followed with great success. Near Hardyville, Mohave County, some Mexicans have struck surface diggings that pay well. We understand that work upon the Williams' Fork copper mines will soon be resumed.

COLORADO.

Georgetown *Miner*, Dec. 10th: Work on the Emmet lode is progressing favorably, and the crevice is carrying a fine body of mineral....Mr. Linn is taking out some very nice ore from the Denning lode, on Republican Mountain. Work on the adit is progressing rapidly....Stewart is engaged in smelting ore from the Robert Emmet lode, situated on Sherman Mountain.

The crevice in the Elephant lode on Brown's Mountain, is six feet four inches wide, between solid granite walls, carrying strings of very fine mineral through the gangue. The shaft is only 10 ft. deep, as yet, and the ore from the grass roots assayed $247 per ton. The ore carries con-

siderable brittle silver....We were shown a day or two since a fine button of silver bullion, weighing 28 ozs., which was taken from 50 lbs. of ore from the El Dorado lode situated on Saxon Mountain. This is at the rate of $1,472 coin, to the ton of ore. The owners of the property are running an adit on the vein, which is now in 50 feet, and carries from two to ten inches of sulphuret ore.

The shaft on the Terrible lode is now 112 ft. deep, carrying from eight to ten inches of first class ore. The ore vein on this lode has been continuous from the surface down.

Promising silver discoveries have been made in the northwest portion of Cascade district. As far as developed the veins carry decomposed quartz, black and gray sulphurets of silver, some little galena and a trace of zinc blende and copper....Ten lodes, considered by competent judges as true fissure veins, have been discovered. Among this number is the Charter Oak, which has been worked the most and has a crevice from 20 to 24 inches in width.

It is an undisputable fact that our mining interests were never in as healthy condition as at the present time. During the season it has been conclusively proven that silver mining can be prosecuted with profit, and that we have a large number of veins that will pay for developing. This has been proven by slow and tedious hand labor. But a new era is dawning upon us in mining. The introduction and successful operation of the Burleigh machine drills, the rapidity with which tunnels and levels can be driven and shafts sunk by their use, gives a new phase to the problem of quickly reaching great depths, as well as to the increase in the production of ore.

IDAHO.

Walla Walla *Statesman*, Dec. 11th: A miner just down from Perry Creek brings late news from the new diggings: In following up the creek the gold is found to be much coarser than at the place where the original discovery was made. All the claims had been laid over for the winter. A large party of Chinamen, under the protection of the Gold Commissioner, had attempted to gain a lodgment in the new diggings, but were driven off by the miners. The ground as far as prospected showed a yield of an ounce a day to the hand, but many of the claims will pay much better than this. Some 200 men will winter in the mines. The discovery was made too late in the season to ascertain with any certainty the extent of the mines, but the belief is that the camp will be a large one—numbering probably 2,000 miners. A large number of Montanaians are wintering in the Bitter Root Valley, preparatory to making an early start for the mines in the spring.

NEVADA.

HUMBOLDT.

Unionville *Register*, Dec. 26th: Fall & Co. shipped this week, per Wells, Fargo & Co's express, 2,000 ounces of fine bullion.

The Silver Mining Co. shipped this week, per W. F. & Co's express, 1,876 ounces of bullion.

Buck & Kimball are steadily at work on the Pride of the Mountain ledge. They have run short tunnels to the ledge at four different points, and struck rich ore in each. The most substantial work yet done is an incline tunnel, now in 100 feet, at the bottom of which the ledge is four feet thick, beautifully cased in granite, and separated from the walls by a thin sheet of clay. Sufficient work has already been done on the ledge to prove it a true fissure vein of enduring richness. The proprietors are having the ore sacked and shipping it to Swansea for the purpose of reduction. They have already made one shipment of 20 tons of assorted ore, that will work $500 per ton, and have 30 tons now sacked on the dump and ready for shipment, that is equally as rich. Parties in San Francisco offer to pay all charges, ship the ore, and advance 60 per cent. of the pulp assay and the balance when they get returns, which takes on an average about seven months; but I understand that the company thus far have asked no advances, preferring to ship on their own responsibility.

REESE RIVER.

Virginia *Enterprise*, Dec. 31st: The White Pine excitement continues unabated, owing in some degree to the favorable weather which has thus far prevailed, but principally to the exciting reports of parties daily arriving from that region. Men of all classes have but one story to tell in regard to the richness of the mines. Assayers, old mining superintendents, miners and all who have visited White Pine, agree in saying that it is the richest silver region ever discovered on the face of the globe. As to its extent, not much is known. Some eight or ten rich veins or deposits have been opened, and the owners of the famous Eberhardt have sunk a shaft on their ground to the depth of 85 feet, finding the rich ore to continue as far down as they have gone.

Austin *Reveille*, Dec. 24th: The mill of the Silver Peak and Red Mountain Co. which has been almost rebuilt during the past four months, is now working perfectly in every department. The mines—the gold-bearing ledges of Red Mountain are the only ones that are being developed at present—are producing large quantities of ore which is carefully assorted and classified as first, second, and third grades, the yield of which will range from $15 to $200 per ton. The quartz occurs in such vast quantities that the process of extracting it resembles quarrying rather than mining.

Dec. 28th: Yesterday, 10 bars of bullion, of the average fineness of .950, and valued at $12,747.33, were brought into this city consigned to W. S. Gage & Co. They were produced by the Centenary mill in the district of Newark.

A White Pine correspondent writes: While the mills here are engaged in crushing lots of ore from various mines, with about the average results, the mines are being opened with a fair, and, in many cases, with encouraging prospects. The high prices of labor, however, ($6 per day) now prevailing, tend to discourage any very extensive working of claims at present; there being but little object in getting out ore where there are no mills for crushing it. About ten days ago a streak of very high grade ore was struck in the Mazeppa claim, lying ¾ of a mile south from and about 500 feet below the Eberhardt mine. The discovery, which is really of importance, considering the excellence of the ore, its considerable quantity and the locality in which the ledge is situated, caused a great rush to the neighborhood, where there are now about 300 men, busily engaged prospecting for and locating claims, more than 100 of which have already been taken up in the vicinity.

Dec. 31st: Ten bars of bullion were brought into this city this morning by Wines & Co's stage from White Pine.

We learned this morning the result of the working of 90 tons of ore produced by the Aurora mine—not the Consolidated—of White Pine. The lot yielded six bars of bullion, valued at $10,667. The Aurora was bought by the brothers Stanford, of California, on the 12th inst, and we were assured that there were on its dump a few days ago, 300 tons of ore, the estimated value of which was $223 per ton. The 90 tons of ore which produced the six bars of bullion are represented to have been taken from the mass of the mine without any assorting.

[For late news from White Pine, see another page of this paper.]

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Dec. 29th: The Yellow Jacket Co. yesterday morning shipped by Wells, Fargo & Co., eight bars of bullion, weighing 614 pounds, valued at $17,686.99.

A drift for the opening of a new level at the depth of 1,080 feet from the surface has just been started in the Imperial-Empire shaft.

Dec. 30th: The new shaft of the Ophir is now down nearly 600 feet.

Jan. 1st: The Savage Co. yesterday shipped, per Wells, Fargo & Co., 13 bars of bullion, valued at $21,796.34, and weighing 845 pounds.

Jan. 3d: The total shipment of bullion from this city and Gold Hill during the past week, was 5,416 pounds, worth $149,406.68.

Gold Hill *News*, Dec. 28th: A good body of pay ore is developed and being worked in the Alpha mine, at the 900-foot level, being the same good streak found in the Imperial at the same level. It is about five thick, and lies next the east wall of the ledge.

The Pioneer mill at Silver City was recently started up.

NEW MEXICO.

Santa Fe *Gazette*, Dec. 5th: Rich silver mines have been discovered by a prospecting party in San Andreas Cañon from La Mesilla. The prospectors report most extravagant stories in regard to their richness.

The Albuquerque *Review* gives the following: Wm. Brentlinger, of Real de Dolores, reports further development of mineral at the Placeres, that Geo. G. Brown, after examining the prospect, has determined to remove his quartz mill from the Moreno mines thither, and it is now *en route*, that a new silver lead, south of Real de Dolores, assayed 240 ozs. to the ton on one trial, and over 600 ozs. to the ton on another.

A letter dated Sorocco, 22d inst., says: Hubbell and Chavez came into town last night from the mines. They brought in the precious metal, and have now 300 lbs. of it that is at least 50 per cent. of clear silver. The mines referred to are west of the Magdalena Mountain.

OREGON.

Portland *Oregonian*, Dec. 19th: L. W. Felton, who has just returned from a trip through Southern Oregon, showed us yesterday a specimen of almost pure copper, obtained from a creek in the Bohemia district. He represents that a company has a large lode near where this specimen was found, which is believed to be almost pure copper.

The mines on the Grand Ronde river continue to yield good wages to the few who are at work.

The Dalles *Mountaineer* gives the following from Cañon City: Several new claims have lately been opened on Pine Creek, near Cañon City, which promise from the prospects to pay well. The quartz mill of Williams & Co. has arrived and will soon be set up and put in motion. The location is about three miles east of town, near the Prairie Diggings.

WYOMING.

Sweetwater *Mines*, Dec. 12th: There are many gulches in the Sweetwater country that have not been worked at all, which will, in all probability, be worked next year.

There have been but two or three companies at work upon Rock Creek, this year, and they have worked upon the claims which were abandoned last spring, but their labor has been so amply rewarded that others have been excited, and now the whole gulch is re-located for three or four miles below Atlantic City, and two or three miles above the town. Undoubtedly the whole gulch will be worked next year, and a large amount of dust taken from it.

J. M. Neall, who arrived recently from the mines, brought with him two of the most beautiful nuggets that were ever seen in any country. The larger weighs nearly five ounces, and the smaller one about four ounces. They are of bright, pure gold, and were taken out while working with a long tom in spring gulch.

We were shown 61 ounces of beautiful gold dust, at the bank of Tiernan & Williamson, recently. The dust came from the placer mines on Sweetwater, and was of very fine quality.

We were shown some fine specimens of quartz this morning from the Nugget and Hartford lodes, in Sweetwater. The ore will prospect from 20 to 30 cents to the pound. The lodes are located in Shoshone district.

[Written for the Mining and Scientific Press.]

N. Y. Society of Practical Engineering.

MODERN IMPROVEMENTS IN MINING.

A regular meeting of the above named organization was held at the usual place, Cooper Institute Building, New York city, on Tuesday evening, Dec. 8th, the President, James A. Whitney, in the chair.

Mr. Wm. B. Harrison read the regular paper of the evening, the subject being "Modern Improvements in Mining."

The writer sketched the progress of this class of mechanism in the various phases, from the primitive wash-bowl to the improved machinery of modern times. The employment of new explosive materials in the operations of mining, tunneling, etc., was considered at some length, after which the writer explained the structure, operation and resultant advantages of the pumping machinery commonly employed in England and the United states in deep mining.

The verbal consideration of the subject, which followed the reading of the paper, related mostly to the mining of the precious metals. A. W. Hall, of New York city, stated that during his mining experience in the Rocky Mountain gold-bearing district, the greatest difficulty encountered had been in the separation of the gold particles from the black sand, in which they occur. This separation was the most effectually secured by the common method of amalgamation, a process which has of late years been greatly improved by the application of the mercury as a coating on copper, this mode effecting a great reduction in the quantity of mercury required. The speaker also described an amalgamating device of his own invention, with which he had secured very good results. In this apparatus the pulverized ore, suspended in water, is carried by the current through a syphon furnished at the lower extremity of its long arm, with an elbow or head. This elbow forms a kind of receptacle or chamber, which, being filled with mercury, the ore is carried through the latter, and thus the amalgamation of the gold is brought about.

A gentleman present, who stated that he had passed some years in California, gave an interesting description of the system of hydraulic mining in use in the above named State, and doubtless familiar to all or most of the readers of the MINING AND SCIENTIFIC PRESS.

A member explained the calcination and treatment of sulphurets containing precious metals, as ordinarily carried on. He also mentioned the necessity of pulverizing certain silver ores in a dry condition, and recommended for this operation the apparatus consisting of stamps working in an air-tight chamber, from which, by a strong blast of air, the fine particles are carried to another chamber, where, being allowed to settle, they are collected for subsequent treatment to separate the silver.

Dr. J. V. C. Smith, ex-Mayor of Boston, gave a brief but interesting account of a personal interview with the celebrated Humboldt, in which the latter stated that the immense expenses of the Russian government were sustained in no small degree by the products of the gold mines in the Ural Mountains.

Dr. Smith also described an antique turbine wheel which he had seen in operation during his travels in the Orient, in one of the valleys of Anti-Lebanon. The Arab attendant asserted that wheels of this kind had been used by his forefathers from time immemorial.

This discussion was kept up with much spirit and interest until the hour for adjournment, but related mainly to minor points concerning the subject in hand. Attention was called to the fact that the flutter-wheels employed in the Sacramento Valley are identical with the Persian wheels used in remote antiquity for raising water upon the banks of the Nile and the Ganges. It was also remarked that among barbarous people the mining of precious metals is confined to obtaining them from where deposited in a simple metallic form, while the operations in the same line among enlightened races the greatest and most profitable results are secured by costly and complex processes and elaborate machinery for separating the minute particles from their combinations with other materials.

The society adjourned for two weeks, after the announcement from the chair that the stated subject for the following meeting would be "The Prevention of Disasters at Sea."

CO-OPERATION.—John Stuart Mill has recently written a letter upon this subject to the *Illustrated News*, in which he makes use of the following language: "I am quite of the opinion that the various forms of coöperation (among which, the one most widely applicable at present to production, as distinguished from distribution, is what you term the system of small percentage partnerships) are the real and only thorough means of healing the feud between capitalists and laborers, and while tending to supersede trade unions, are meanwhile a natural and gradually increasing corrective of their operation."

"BOURBOUZE."—The new French gas light under this name is thus prepared: Coal-gas, intimately mixed with atmospheric air, is urged by gentle pressure through a tube, and passed through a metal plate full of little holes. Many jets are thus formed, which, after being driven through a fine tissue of platinum wire, are lighted. The platinum soon becomes white hot, and so brilliant that the eye can hardly bear it. One cubic metre of gas is consumed per hour.

THE Union Foundry of San Francisco will furnish the machinery for the grain elevator at South Vallejo.

San Francisco:
Saturday Morning, Jan. 9, 1869.

Notices to Correspondents.

BAROMETER.—No reason seems to have existed for predicting that the present winter would be a very dry one, and consequently adverse to the growth of the forthcoming wheat crop. On the contrary, as far as ordinary appearances have occurred, reasoning from the analogy of former years, at least an average rain-fall for the seasons 1868-69 might fairly be anticipated. Our rain-fall, and the general hygrometric state of the atmosphere, is usually found to depend so much upon the direction of the wind, rather than its specific gravity, that the useful instrument whose name you have assumed as a *nom de plume* has, with many in this State, almost fallen into disuetude. Occasions, however, occur sometimes in which the indications of that valuable instrument may be studied by the working farmer to great practical advantage. A very instructive lesson of the kind has taken place during the current week, the first part of which, to all external appearances, threatened a very heavy and continuous rain-fall. Owing, however, to the denser condition of the atmosphere as indicated by the barometer, we were only annoyed with dense fogs, which cleared off as the sun became more powerful and approached its meridian. * * As these remarks were written during the fine days of the commencement of the week, superficial observers may imagine that the observations made have been negatived by the rain-fall which took place on Thursday evening, which, however, did not occur until a fall in the barometer had taken place, and even with that fact the pluviose element ceased on the appearance of day.

H. W. O. M., Boise City, I. T.—The name of the gem is not chisoprase, but *chrysoprase;* the magazinist referred to being at fault. Your Greek scholars will have no difficulty in finding the roots of the latter word. The mineral is a leek-green, translucent quartz, more properly chalcedony, colored by nickel. From *chrys,* gold, and *prase,* leek,

COMMUNICATIONS have been received from "C. H. A." Owen's River; from "H. M." Boise City. "P. S." Batopilas, Mexico, is in typo and will appear next week.

L. C., Monitor, Alpine County.—Your *suite* of rocks and minerals met with in your tunnel, is interestiug, and will be attended to.

THE NEW MINTS.—During the past year the Branch Mint building at Carson City, Nevada, has been completed, and the necessary machinery and fixtures have been forwarded. The new Mint at San Francisco will not be long in getting into operation. Its cost is estimated at upwards of a million of dollars. The entire deposits at the Branch Mint in San Francisco, were formerly in unparted bullion; now nearly two-thirds of the amount is deposited in bars refined by private establishments.

Amalgamation with the Aid of Electricity—The Nolf Process.

We are enabled, this week, to furnish our readers with something more definite regarding the Nolf electro-metallurgical process, whereby an electric current is brought to bear to facilitate the desired chemical operations in pan amalgamation, under conditions in many respects nearly identical with the Patio Process. Such is Mr. Nolf's invention,—reference to which, in our columns, will be remembered in connection with a notice of experiments that have been making at the Union Foundry under the auspices of Mr. Pioche, the especial patron, and substantial abettor, of the process.

A number of metallurgists and mining engineers were present, at the somewhat extensive works which have been called into existence for especial development of this process, on an extensive working scale, at the corner of Valencia and Seventeenth streets (Mission), on Tuesday last, to witness the first public test of the principles whose practical application to meet our great recognized metallurgical want—a process of gold and silver amalgamation without roasting in presence of base ingredients—has occupied the close attention of a number of very competent men that we know of, for months, and even years, so far as Mr. Nolf is concerned; and the results of which are now given to the public in a manner so definite, and so plainly indicative of entire confidence on the part of the experimenters, who have thoroughly tried it all, and of financiers, too, that we feel justified in calling attention to the process as one certainly promising a great deal on that ground alone; and as worthy, in virtue of its importance, of the examination of all who may be in a position to derive benefit from the attainment of so important a desideratum.

But the process is really well founded theoretically, on incontrovertible principles of science, and in a most interesting department thereof. It is such as one may take pleasure in tracing, from useless observed phenomena into theory, and from generalizations into practice, where it may possibly be worth its millions to the industries of a people—a practice which links our every day, money-making pursuits, with the operating force which lies, as we shall see, at the very foundation of the philosophy of all things terrestrial,—to the profoundest central principle to whose operations mortal reason has been able to trace the foundations of chemistry, geology and physics—the very *ultima thule* of science, where we become alchemists again, like our metallurgical predecessors the fathers of civilization in the middle ages, but on a basis of enlightened and established truth; a field where, in apprehending the electrical nature and characteristics of the affinities between simple elements, we find ourselves at the boundary, still groping in darkness, where we discover analogical principles governing the birth and procedure of vegetable, animal and spiritual life. We arrive at the great and mysterious first principles of the Positive and Negative, the giving and the receiving, the masculine and feminine principles, which exist as the fundamental moving cause throughout all nature; from electricity, the attendant and equivalent of all chemical action, to like material manifestations of a more subtle character, concerning the higher laws of which we are not yet able to generalize.

It was Becquerel, the renowned author of "*Traite experimentale de l' ectricite et du magnetisme*" (1834), who, in the midst of his enthusiastic labors in this field, first sought to take advantage of the facts that artificial electricity will facilitate not only chemical decomposition of compound substances, but also re-combinations, under certain conditions; that the metallic elements are all relatively to each other positive and negative, in the order (according to Berzelius and others), from positive to negative, of the earths, zinc, iron, lead, tin, bismuth, copper, nickel, silver, antimony, mercury, platina, gold; being conductors of electricity, and of heat, in nearly the same order; that when they are put together in a tub, and a current of electricity is led through the same, they are attracted and caused to move, relatively and respectively towards the positive and negative poles, in the same order and relation to each other.

Non-metallic elements observe the same law; the simplest illustration of which is the decomposition of water in putting the positive and negative wires into it, the oxygen gas gathering around the positive pole, and the hydrogen around the negative, so that they may be caught in inverted glass bells, and tested, by burning separately, showing a difference of color in the flame, etc.

The salient laws, touching this electro-metallurgical process, were developed, however, by numerous others besides Becquerel. It was only in 1800 that Galvani and Volta discovered galvanism – chemical electricity—; then Brignatelli made a long list of experiments showing how the fluid would decompose different salts, transferring the elements to different poles; and Cruikshank, the discover of the galvanic battery, observed how the metals in acetate of lead, sulphate of copper, nitrate of silver, etc., were separated out, or "revived," as the expression was.

Becquerel established metallurgical works at Greuelle, near Paris, and labored enthusiastically in the attempt to make some practical use of these remarkable principles, but without success by the dollar criterion (which governs metallurgy as inevitably as does natural law)—and others, both wise and unwise, have tried it since, with various results, the history of which would occupy too much space to be gone over in this connection. *Dingler's Polytechnic Journal,* and the *Berg und Hittenmannische Zeitung* have had accounts of recent attempts in Europe. THE MINING AND SCIENTIFIC PRESS, page 306, Vol. XI, contains an account of various trials in connection with amalgamation, at Gold Hill, and other places in Washoe, at different times, and within a few years. Amongst the experimenters were John A. Scott, S. Kean, B. R. Norton, Col. Brevoort, and others, both in this city and in the State of Nevada.

Mr. Nolf is not a new experimenter in this matter. He has been cognizant of all the difficulties that were encountered, and has labored with very creditable perseverance in his endeavors to overcome them. He was himself a pupil of Becquerel's, from whom he proudly acknowledges that he obtained his ideas, while his own success and the credit to which he is entitled, are to depend on the degree of making the same practically and economically available. How far California will be indebted to Mr. Nolf, we hope to be able to show hereafter, by further details of practical tests at his works, than we are able to find room for at present.

The establishment at the Mission consists of a large working room; a pan, or rather a tub, being of wood, of large size, to contain and manipulate the ore; a very powerful voltaic battery, of about forty vessels, arranged on a table along one of the walls; a laboratory in an adjoining room; a number of tanks outside, to wash the amalgam; and numerous tubs, tanks, crushers, with assaying tools, etc.

As an illustration of the basis of the process, our attention was first called to an interesting experiment, made with some quicksilver in a large porcelain dish containing also salt water. The two poles, represented by the two wires of the battery, were brought into the salt water on opposite sides of the quicksilver; the result was, that the metallic substance eagerly ran to the negative pole, and followed it wherever it went. Then the negative pole was taken out, and the positive pole put into the middle of the quicksilver bath; immediately its surface began to tarnish, to coat over, whitening and becoming variegated with chloride of mercury (calomel, Hg^2 Cl) which increased so rapidly that it must finally have destroyed the quicksilver. But the wires were now placed again as at the beginning, and in half a minute, with a little stirring from the negative pole, the calomel was entirely decomposed, and the quicksilver was as bright as ever. During all this there was a very distinct smell of chlorine gas, arising from the decomposition of Na Cl of the salt water. It was remarked, as a point that might have some influence in the Nolf process, that the separation of chlorine might leave the sodium in a condition to form sodium amalgam; but it is doubtful as to whether the sodium would not be in an oxidized, rather than in a metallic condition.

Next a quantity of sulphate of copper was poured into the dish. While the electric current was applied, no result was observable, but from the time it was removed it was not long till the quicksilver was almost entirely destroyed by the chemicals; the coating being darker and thicker in this instance than in the previous one, and the destruction more rapid. Here bi-chloride of copper (Cu Cl) was formed, with the calomel on the surface of the quicksilver, and sulphate of soda in the solution. The wires were now applied once more, and in a few minutes the quicksilver bath was as clear as before; the effect of the electric current having been to reduce the bi-chloride of copper to the sub-chloride (Cu^2 Cl), which is harmless to the quicksilver. Electricity, therefore, prevents the formation of the destructive bi-chloride of copper in amalgamation, or if the same be formed, reduces it.

As the chemicals used are the same, in operation and in fact, as the salt and the magistral used in the patio process, these experiments will be admitted to have a definite value. It is true that the chemistry of the patio process is explained in half a dozen different ways; but the ordinary one is that the bi-chloride of copper acts on the sulphide of silver, and the elements interchange, forming sulphide of copper, and chloride of silver: (Cu Cl + Ag S = Cu S + Ag Cl).

Concerning the operations in the pan or tub, there were put in 700 pounds of Alacran (Copala, Mexico) ore, consisting of mixed sulphurets of iron, copper and silver; a very complex, refractory, roasting ore, which cannot be treated at all by the patio process. After 20 to 24 hours of working with this ore, they have obtained 80 per cent. of the fire assay. On a smaller scale they have obtained 92 per cent.

The tub is, of course, insulated as well as the battery, standing on glass plates. A simple stirring apparatus revolves in the tub (by hand power at present) and the negative wire connects with this, being so arranged that the current runs down on the copper covering of the stirring arms, and thence passes through the pulp to the inner surface of the tub, which is copper lined, for the purpose of affording a conductor. The bottom is of wood.

In working, the quicksilver being at the bottom, and there being no grinding, little particles gradually become detached by mechanical mixture with the pulp, and follow the stirring arms in virtue of their electrical attraction till the entire pulp has been searched, and the amalgam finally is collected as much as the friction will admit, on the stirrers.

There was an evident tendency of the amalgam formed in the tub towards the stirring arms, or negative pole. It could be sliced off, after a few hours, with a knife. On accumulating to a certain thickness, some of it would fall off, but the electric action is in no wise hindered,—on the contrary strengthened, by the thickness of this coating, precisely as is the case in the electrotyping process,—which might have been referred to in many other respects in illustration of the principles here described.

Of the actual chemical decompositions that took place in the pan, we may say something hereafter, though that question can scarcely be met by anything more than conjecture at present. We know that chlorides are first formed, and these are then amalgamated.

In washing the pulp, after amalgamation, it is run over copper plates charged from an electric battery. The little particles which are ordinarily so apt to be washed away, are thus powerfully attracted to the copper plates and easily induced to separate themselves from baser substances.

We intend to report the progress of this important process from time to time.

OFFICE REMOVAL.—The office of the Mohawk and Montreal Mining Company, Nevada County, has been removed to this city, No. 414 California street, by vote of the stockholders.

California Petroleum and its Utilization.

Reference was made a few weeks ago to the non-utilization of our California petroloum, while thousands of barrels of it might be had in the market at a very short notice, from the southern coast. Whatever the real difficulty was, the significant fact remained undisputed. We stated that the California petroleum was heavier than the Eastern, and that objections had been made to it on the ground of its showing a greater liability to smoke. It is claimed by those whose opinion is entitled to respect, that California petroleum is in reality as good as the Eastern for lighting purposes; that, having more body, it will burn longer, and at the same time fully as brightly as the Eastern.

A little chemical information about the separation of the oils into their constituent elements, will best illustrate the position of things. Oils are called hydro-carbons, being combinations in varying proportion of the carbon, or coal-ingredient, of vegetable growths, with hydrogens; and sometimes there is a small amount of oxygen added, which does not necessarily belong to the nature of oils. Whether fixed, fluid, or gaseous, their nature is still the same—they are hydro-carbons, or carbureted hydrogen, in slightly varying combinations of the two elements.

The explosive gas in coal mines,—which may be heard issuing from solid coal with a faint crackling noise,—is CH_2; the bad smelling gas of swamps and ditches, where there is decomposing vegetable matter, is quite the same, but harmless because unconfined. Coal lying long exposed in open heaps becomes less valuable on account of this spontaneous distillation. When the carbon doubles, making C_2H_2, as is the case in the olefiant (oil-making) gas of the laboratories, the burning produces a brighter light, as there is more carbon to become incandescent in the act of burning with hydrogen, while hydrogen alone would make only a faint blue flame.

The distillation of these carbureted hydrogens from vegetable bodies, is a constant process of nature. The same thing is done artificially in making coal gas, for lighting, which contains, besides carbureted hydrogen, also carbonic oxide (CO) hydrogen, and nitrogenous "azote," in varying proportions.

It has been maintained by Silliman and others, that the California petroleum is not a product of the dry distillation or carbonization of coal deposits. Antisell and other authorities hold that the Pennsylvania oils are, however, derived from the adjacent coal beds by a perfect process of natural distillation.

Asphaltum is nothing but oil, thickened after the disappearance in the air of the more volatile ingredients, called petroline and naphthaline. The ordinary asphaltum is usually mixed, to a large percentage, with vegetable and mineral substances.

When fine distinctions are attempted, the chemistry of oils becomes an exteusive and complex subject. A little difference in the proportions makes a substance frequently having marked variations as to its characteristics. *Paraffine* is the name given to the product crystallizing like fish scales, which results from distillation of organic substances at temperatures below a red heat; its composition being $C^{20}H^{21}$. When the temperature rises to 340° and 400°, the oils obtained contain creosote, called carbolic acid when it crystallizes.

The heavier oils obtained by distillation contain a singular organic product, first discovered by Fritsche and Runge, which was called by them "Aniline," possessing the property of giving, with certain reagents, the magnificent colors which are now universally used to dye textile fabrics for ladies' wear.

Asphaltine, $C^{20}H^{16}O$, is another of these special products, which particularly characterizes California petroleum, while *Paraffine* is the special characteristic of the Atlantic petroleum. It has simply less hydrogen than paraffine, and is partially oxidized. It is identical with Petroline ($C^{20}H^{16}$) except that it is oxidized, and is therefore solid and fixed, while the former is fluid and volatile.

The cause of this chemical difference between California and Atlantic petroleum may be found in a different modification of the natural manner of distillation by which they were produced, and by the degree of exposure to the air, as well as, perhaps, by the nature of the vegetable substances from which they were derived; which in California were of the Tertiary Age, while in Pennsylvania they were of the Carboniferous, embracing plants of widely different orders.

The discontinuation of the several petroleum refining establishments, which were in operation in San Francisco some time ago in connection with Hayward & Coleman's, Stanford's, and the other oil firms, was owing to the fact that Eastern petroleum could be put in the market at a cheaper price than the figure at which California petroleum could be refined. More definitely speaking, the price of sulphuric acid and caustic soda in this country has been too high to admit of carrying on refining with profit. Therefore it has been abandoned for the present.

Concerning the status of petroleum enterprise, the bulk of it is concentrated in the San Buenaventura Commercial, Manufacturing and Mining Company, incorporated with a capital of two and a half millions, and owning all the springs and wells at Santa Barbara, embracing large tracts of land selected with regard to its petroleum indications,—excepting the Ohai well, situated further inland. This company is at present quietly awaiting the issuance of a patent for some of the lands which have been decreed to them by a late decision of the United States Supremo Court at Washington. Leases have been held by Stanford, and by Hayward & Coleman, etc., for a limited period.

The burning of petroleum is still a question which attracts much interest and attention from engineers in the East and in Europe. Foot's and White's burners are the only ones that have been tried in California, to any extent. The former made use of steam and common air, which were pumped into the burner by means of an air pump, the steam being decomposed by combination of its elements with vaporized oil. A long report has been made, giving the results of experiments and workings at the Ætna Iron Works.

White's burner was in operation for three months at Hanscom & Co's foundry. The necessity for pumping is avoided by its use, but the chemical operation is the same as in the Foot burner. Steam is first conducted through a cylinder containing glowing iron filings, which separates it into hydrogen and oxygen; the resulting gas then enters the burning cylinders where it meets the vaporized oil. The addition of so much hydrogen to the carbureted hydrogen gas filling the cylinder, furnishes a burning material capable of giving the most intense heat, in burning with the oxygon of the air through nipples regulated by suitable stops in the upper part of the cylinders, whence the flame strikes against the boiler. Two gallons of water are thus burned, to one of oil, and about 20 per cent. of the heat obtained is considered to be derived from the burning of the hydrogen of the water. The engine at Hanscom's was 25-horse power; the oil used 6¾ to 8 gallons an hour, at 7½ cents per gallon, making $7.20 in 12 hours. No fireman, or attendant of any kind, is required with this burner, more than in the use of a lamp. Comparing the cost of coal required in order to perform the same service, it was found that one ton of slack coal or screenings (the cheapest and poorest quality of coal), costing $6.75 a ton, furnished about the equivalent as to power; but a fireman being required, the inventor claims an advantage of 45 cents a day in favor of the petroleum burner. Wood being used in Nevada, costing $16 a cord; at about ten cords a day, making $160, it is estimated and claimed by Mr. White, that $7 to $8 a day could be saved in each mill by the use of petroleum shipped from Santa Barbara.

Mr. Mowry, lately a clerk in a hotel at Colfax, is requested to call at the office of the MINING AND SCIENTIFIC PRESS, No. 414 Clay street, below Sansome, San Francisco.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17 4m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

PAIN KILLER.

No article ever attained to such unbounded popularity.—*Salem Observer.*

An article of great merit and virtue.—*Cin. Nonpareil.*

We can bear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch.*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Tenn. Organ.*

It has real merit; as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*

It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.* 26v17-1m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

GEO. P. ROWELL & CO.,
AMERICAN NEWSPAPER DIRECTORY

Containing accurate lists of all the Newspapers and Periodicals published in the United States and Territories, and the dominion of Canada, and British Colonies of North America;

Together with a description of the Towns and Cities in which they are published.

NEW YORK:

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-13 16p

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woolruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

DR. NESTELL'S

LUNG INSTITUTE,

(Branch of the N. Y. Lung Institute)

No. 316 SUTTER STREET,

Between Mason and Powell Streets, San Francisco,

For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.

Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.

Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.

Invalids at a distance, on writing their case, can receive the remedies by Express.

Special attendance out of the city will be charged commensurately with the time and distance occupied.

All communications must be addressed to

D. D. T. NESTELL, A. M., M. D.,
Lung Institute,

We have been shown by Wm. Zelner, the best and most convenient and portable apparatus containing Chlorine, for rooms, which we consider the best disinfectant out, and should advise all housekeepers not to be without one. Price $3, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 18 Geary street, 25v17-3m

Written for the Mining and Scientific Press.

How Brick Houses may be Built Earthquake-Proof.

EDITORS PRESS:—Permit me to give you my views in relation to the construction of brick buildings in the shaky portion of California. Take the plan of a house 40 x 80 feet, three stories, of 12, 11 and 10 feet. Make a foundation of 2-inch plank, put together, every course saturated with hot asphaltum and coal tar; break joints, and fasten with wooden pins, put in at a little augle; make the depth 18 inches, or nine planks, and the thickness 20 inches. By making this foundation of plank, you discover any rot that might exist in solid timber, and the asphaltum cement being diffused through the entire timber, will protect it from decay.

Build upon this foundation your brick wall, of sound, strong brick; make the thickness of your wall equal to the length of two bricks, or one and a half bricks, with a hollow of one and a half inches between the out and inside courses. Every nine courses in hight put on a course of headers, running through the full thickness of the wall, leaving out every alternate one; then fill in the hollow space with hot asphaltum and coal tar cement, and so continue to the completion of the walls. The walls should be capped with timber six inches thick, and as wide as the thickness of the wall. This plate will permit the wooden cornice to be fastened thereto.

Vertical iron rods should pass through the wooden sill, extend up through the space between the two walls and pass through the top plate, secured by a large iron head at the bottom of the sill, a large iron washer and nut at top, and placed sixteen feet apart. I would recommend the usual vertical angular quoin plates at each external angle of the building of cast iron; horizontal wrought iron rods at the termination of each story in hight, passing from flank to flank, and from front to rear, and passing through the quoin plates, and to be fastened thereto. The upright iron rods should be one inch and a quarter, the horizontal rods one inch in diameter.

The center girder of the first floor running parallel with the flank walls may be supported by a wooden arch, made of inch boards put together with nails, about ten inches thick and deep, each course of boards to be saturated with hot asphaltum cement, and to be a segment of a circle the entire length of the inside of the building with strut braces, from the crown to the underside of the girder for its support. The feet of this arch should be well fitted at each end into a heavy wrought iron shoe, well saturated and imbedded in asphaltum cement. The two iron shoes should be joined together by two iron rods, one and one-fourth inch in diameter, forming the chord of the arch. They should also be imbedded in asphaltum cement, and kept even with the cellar floor.

At right angle to the first girder, and upon the top of the same, there should be cross timbers placed about fifteen feet apart, and in one piece from wall to wall. They should be so placed in each story, and in the roof; they should be six inches thick, and of even depth with the joist. The ends of the cross timbers and joists should rest upon bond timbers 4x5 inches; the cross timbers should be bolted to the girder and bond timbers with three-quarter inch wrought iron bolts, and iron rods three-fourth inch in diameter, with an eye at one end to bolt to the end of cross tie, and a screw at the other end to pass through a cast iron flange on the outside of the wall. The inside finish of the house is a matter of taste and convenience. The side walls may be plastered as is usually done, but the ceilings should be finished with board lining, plain or ornamental. The floors should be laid in the usual way. There is no strength gained by laying the boards angularly. Through nailing of floors is stronger than secret nailing, but not so convenient for the carpenters, nor does the floor look as well when done with two nail holes in the floor over each joist to harbor vermin and dirt, as where the nails are hidden.

All timbers should rest upon the walls where it can be made so, for their weight

gives strength to the walls; and where they are properly iron-fastened to the walls, they establish a one-ness to the whole fabric.

One thing is certain—that while masons continue to use such an excess of common lime in their mortar, as one third, instead of about one-eighth, they never can have a cement that can be relied upon. Masons generally suit their own convenience, not the public good, in the preparation of their mortar. Legal statutes only can make a change for the better in this respect.

External cornices and ornamental work should be made of sound and durable wood, and I can see no impropriety in encouraging a proper diffusion of architectural ornaments upon the exterior of buildings, where they are in harmony, begetting pleasure to the eye from their natural fitness.

To recapitulate: *First*—The plank foundation put together and saturated as above, with hot asphaltum and coal tar cement, defies decay and promises long endurance.

Secondly—The hollow walls, which are to be filled with hot asphaltum cement, so as to permeate the brick and mortar, and fill up all interstices, establishing a unity in the substance of the brick walls, such as no other material known can do at the same cost, will resist all damp without, and insure a dry house within.

Thirdly—The segment arch for the support of the center girders instead of piers, throws the bearing weight to two places in the front and rear wall bearings.

Fourthly—The vertical and horizontal iron rods, the binding plate at top of walls, the cross ties, iron fastened, the angular quoins and the flat asphaltum cement roof combined, will make as firm a structure of brick as our necessities require.

J. H. WHITE.

RAILWAY EMPLOYEES MUST NOT BE COLOR-BLIND.—The necessity for a ready distinguishing between red and green is especially evident in the case of railway employés, who are guided by colored signals which must be instantly obeyed. Grave errors have been committed by men who were afterwards found to be totally deficient in the capacity for making the distinctions, and who were themselves ignorant of the fact. In France, the surgeons of the railway companies now subject all candidates for employment to a careful examination upon this point.

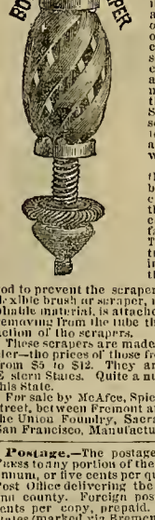
PATENT
Boiler Scraper and Tube-Cleaner.



IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the metals are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.
A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.
These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.
For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

POSTAGE.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Silk in Los Angeles.

Our old friend Louis Prevost, Esq., of San José,—the silk pioneer,—still lives. Nothing pleases him better than to recount the facts which accumulate from seasou to season in proof that the picture, drawn by him three or four years ago, of the future of the California silk culture, was not too highly colored. He sends us a letter received by bim in November, from Thomas A. Garey, of Los Angeles, describing his season's work. We give a portion of this letter, from which it will be seen that nearly two hundred thousand worms were fed from ten tbousand mulherry cuttings, planted last spring. In Mr. Prevost's "California Silk-Grower's Manual," he hases his estimate of profits per acre upon the yield of trees four years old; but it would seem that under tbe peculiarly favorahle conditions of soil and climate to he secured in Los Angeles, the same result may be obtainable in a single year from the planting:

"The first crop of the season was hatched and fed hy D. F. Hall, of San Gabriel. He states that the eggs commenced hatching the 15th of April, aud commenced spinning tbe 1st of June, making forty-seven days from eggs to cocoons. The numher fed at tbis feeding was 40,000, 'fed from 10,000 cnttings four months from planting.' The variety, Chinese Annuals.

Tbe second crop of the season I hatcbed the 25th of May. Commenced making cocoons on the 3d of July, being forty days from eggs to cocoons. Number fed, 20,000. Varieties, Chiuese, Turkish and Portuguese Annuals

The third crop I commeuced hatching the eggs the 5th of July. Commenced making cocoons August 7th, thirty-two days from eggs to cocoons. Variety, Japanese Trivoltines. Number fed, 3,000, from cuttings of spring growth.

Fourtb crop commenced batching August 31st. Commenced spinning September 26th—twenty-seven days from eggs to cocoous. Variety, Japanese Trivoltines. Number fed, 98,000. Fed entirely from 10,000 cuttings hetween eight and nine mouths from planting.

Fifth crop now hatching Nov. 7tb. I can see no reason why they will not do well. This crop is more experimental than otherwise. The eggs, as well as the different crops spoken of above, hatched spontaneously, without any artificial beat whatever."

Inventor's Exchange.—The *Scientific American* urges the establishment of a "National Invention Bureau" in New York. It says:—"What we need is at least ono national collection of new inventions, where tho machines or devices are not labelled and filed away in glass cabinets, but aro exhibited in operation, so that 'he who runs may read.' This can hardly be done by private enterprise, hut should be the result of association; such an association as would demand and secure the confidence of manufacturers, mechanics, inventors, and others interested. The American Institute is the proper body to establish such a bureau in this, the commercial metropolis of the country. That it can he done without governmental aid, National or State, is evident to one who bas the means of forming an opinion. That it would be self-sustaining, and even profitahle, there can he little doubt. Every exhihitor to this perpetual fair would willingly pay an entrance fee for his invention, and a rent for space allotted to him, and for power employed. He could well afford it, as the action of his machinery, governed hy his ageut, who should be competent to explain its operation and advantages, would he a perpetual advertisement, more powerful than columns iu a daily or weekly journal. Besides this, the products, or a certain percentage of them, might be claimed hy the Association, and thus another source of revenue to the enterprise he opened. Of course, such an establishment would become one of the 'lions' of tbe city. Everybody who visited New York would think their visit to have failed of its intent if they did not see the contents of the Mechanics and Inventor's Museum."

Would uot something of this kind be worth carrying out in San Francisco?

Mineral Spring.—Mr. Firebaugh, of Sycamore Creek, Fresno County, has discovered near his residence a fiue spring, whose waters are impreguated with alum and iron.

Beds of jet black marble exist in Tuolumne County.

New Inventions.

Fire and Earthquake-Proof Chimney. Peter Portois of this city, has applied for a patent on an invention called "Portois' fire and earthquake-proof chimney," which is constructed on novel principles. The flues, which may be of any number from one to half a dozen, are round and made of galvanized iron. Outside the flues and separated from them by a space sufficiently great to ensure entire safety is a double wooden box, well painted and fastened together, and the space hetween the boxing and flues and hetween the several flues is filled witb a concrete compound of clay, brick, gravel, etc., which cannot he burned away, and will not allow the fire or heat from the flues, if ever so great, to do any damage to the wood work. The cost of such a chimney would be 25 per cent. less than that of a common brick one, and auy mechanic can put one together in a few bours.

The Steam Plow at Oroville.—Speaking of the steam plow in process of manufacture at Oroville, the *Record* says:

The steam plow, now about ready for trial at the machine shop of Locher in this place, has all the advantages claimed for tbe Scotch invention, viz., lightness, durability, efficiency of work, and can he afforded cbeaper tban the Edinburgh plow. In fact, we claim for it all that the foregoing article calls for, and believe that it meets the great wants of the age—an agricultural locomotive. It can be made to perform all heavy agricultural work, such as hauling, plowing, harvesting, planting, sub-soiling, and can he run into the mountains, and employed for sawing and hauling fencing. It will he in operation next week, aud its success demonstrated.

Patent Globe.—Dennis Townsend, of Springfield, Vt.,—at one time Superintendent of public schools in Amador County—has invented a new globe for the use of schools, which is said to be superior to the globe now in use, from the fact that it can he changed from its globular form and used as a wall map, or folded up and put into an ordinary atlas. The iuvention is highly recommended by the Massachusetts *Teacher*.

Railroad Mail Bag Catcher.—The new mail bag catcher has been adopted on the Chicago, Burlingtou and Quincy Railroad. It consists of a rod of iron, with a rod branching off so as to form a V, in wbich the hag is caught. It is ranged across the side door of a car; has a handle to he worked by hand, and a string at one end, so as to break the force.

Method of Burning Brick.—D. C. Lucien, of this city, has applied for a patent on a new method of burning brick. Instead of burning the kilns with wood in the arches, he lays the bricks up with hroken coal betweeu them, and when tbe kiln is complete, sets fire to it at the hase. He hurned 150,000 brick by this process, at a cost of only $67.50; by the old method the cost is about $5 per 1,000.

Champagne Tap.—John Foster, of Marysville, bas patented an invention whereby a champagne hottle may he set up like a keg of lager, and tapped with a miniature faucet through the cork. When a little champagne for a cocktail is wanted the faucet is turned.

J. D. Stagg, of Santa Cruz, has invented a shiugle machine that will save the work of three men.

A gentleman in Reno has invented a new wood cutting machine, whicb is said to be an excellent thing.

Governor Blasdel, of Nevada, who visited this city recently on behalf of the Aurora Consolidated Mining Company of White Pine District, entered into a contract with Frank Livingston to furnish for one year all the ore which a 30 stamp mill, to he erected hy the latter, can work—from 8,000 to 12,000 tons—at $25 per ton, being half of the present White Pine rates; and the ores are to he worked hy Livingston to 80 per cent. of the fire assay. Gov. Blasdel estimates the average yield at $100 to tbe ton; so that 10,000 tons would produce $1,000,000.

Polytechnic Society.—The adjourned meeting of friends of the Polytechnic Society, to perfect its organization, takes place at the Mechanics' Institute on Monday evening next.

Agency at White Pine.—Alexander Bruckman, at Hamilton, Wbite Pine District, Nevada, will act as agent for the Mining and Scientific Press, in that locality.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR JANUARY, 1869.

The following Steamships will be dispatched on dates as given below:

January 6th—SACRAMENTO.....Capt. W. H Parker, Connecting with ALASKA, Capt. Gray

January 14th—MONTANA.....Captain A. We Connecting with RISING STAR, Capt. King.

January 22d—CONSTITUTION.....Capt. Wm. H. Hudson Connecting with HENRY CHAUNCEY, Capt. Connor.

January 30th—GOLDEN CITY.....Capt. W. F. Lapidge, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Hoane, will be dispatched on MONDAY, January 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets

OLIVER ELDRIDGE, Agent.

MECHANICAL AND ARCHITECTURAL

Drawing School

—FOR—

APPRENTICES.

MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. 414 CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

CIGAR AND CIGARETTE

Roller and Wrapper.

This useful little article is the GREATEST INVENTION of the age for the benefit of smokers, reducing the cost of Cigars and Cigarettes to the mere cost of the Tobacco. Very convenient to carry in the Pocket, producing no smell, and adapted to the use of any tobacco. In two sizes and three styles—Japanned, Brass, and Silver-plated. Sample machines, with 100 wrappers, sent free of postage on receipt of $2. The highest prize awarded at the Fair of the American Institute, September and October, 1867 For particulars, address H. C. Witt, 57 Cedar street, New York.

Beware of infringements. All genuine have my name printed on the bands.

E. M. DEWEY, Agent for Pacific States, 423 Washington street, San Francisco. 24v17-6m

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,

Room 37 New Merchants' Exchange, California street San Francisco 17v15-tf

THE CELEBRATED

IMITATION GOLD

$15. Hunting Watches. $20

CASES OF THE COLLINS METAL (IMPROVED OROIDE)

Special Notice.—Our superior Oroide Watches having recently been imitated, and worthless watches sold in New York, Boston, Chicago, and other cities, represented as our watches, we hereby caution the public against them, and give notice that we are in no way responsible for these bogus concerns, and only those purchasing directly from us can secure a genuine Watch of our manufacture. We have recently greatly improved our Oroide in appearance and durability, and, to protect the public from imposition hereafter, have named it the "COLLINS METAL," and we give notice that any one making use of this name will be prosecuted to the extent of the law.

This metal has all the brilliancy and durability of gold; cannot be distinguished from it by the best judges; retains its color till worn out, and is equal to gold excepting in intrinsic value. All our Gentlemen's Watches are *Full Jeweled Patent Levers;* those for Ladies an improved Escapement, better than a lever for a small Watch; all in Hunting Cases, and fully guaranteed by special certificate. The $15 Watches are equal in neatness, style of finish, general appearance, and for time, to a gold one costing $150. These for $20 are of *extra* fine finish, and are fully equal to a Gold Watch costing $200. Chains of every style, from $2 to $6. Also, Jewelry of the Collins Metal in every style.

To Clubs, where six Watches are ordered at one time, we send ONE EXTRA free of charge. All our prices are in Currency.

Goods sent to any part of the United States by express, to be paid for on delivery. Money need not be sent with the order, as bills can be paid when goods are taken from the express office. Customers must pay all express charges. We employ no agents; orders must therefore be sent directly to us. Customers in the city will remember that our *only Office* is

Nos. 37 and 39 Nassau street, New York,

Opposite the Post Office, (up stairs.)

C. E. COLLINS & CO.

Citizens of Toronto and the Dominion generally, take notice. We have hundreds of testimonials. But you need no further evidence than the following from one who is well known among you. Here is his proof positive.

Harry Hazleton, the well known author, says:

"I have always looked upon cheap watches as humbugs, and dealers in them as little better than swindlers. At the request of a friend, I have worn for three months, the watch he purchased of C. E. Collins, and for which he paid $15. It accurate time, retains its perfect golden appearance, and I can really see no difference between it and my own, which cost five times the amount of the Collins Watch."

Mr. Hazelton adds:

"I have since purchased FIVE of these watches, at the request of friends, and those for whom they were intended are perfectly satisfied. Others are seeking for them, and I fancy that Mr. C. will find some difficulty in supplying the constantly increasing demand."

☞The regular price of the watch is $15, and others costing $20. These are superbly finished, and really superior to any article placed upon the market, costing five times that sum.

Office State Capital Reporter, 42 and 44 J street, Sacramento, Cal., July 15, 1868:

C. E. Collins & Co.—Gentlemen:—Wells, Fargo & Co. delivered Watch and Chain, as per order, paid bill on presentation. The Watch and Chain give entire satisfaction, and several of my friends wish the same quality of watch and chain. One is chief editor of this paper, and two others are the publishers of this paper, and the others are for friends of mine, and by wearing your goods will make you a large sale in this city. I therefore wish you to send me seven watches and seven chains, of same quality as those you sent me, price paid you $15 for watch, and $6 currency for chain. I return you the guarantee, it may assist you in ascertaining the exact kind of goods sent me, the number of the watch sent is 66,932. If this order sent turns out as satisfactory as the first, we will give you a good editorial notice, and help you along as far as practicable. I send this order not for my benefit, but for yours and to accommodate my friends. Send to E. K. Phipps, office of "State Capital Reporter, Sacramento, California."

Yours, respectfully,

E. K. Phipps.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the multer forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumferenee as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in coatact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION
PATENT)

Variety Molding and Planing MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Accent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application.

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and language; is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send thither, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Montgomery Block. Prompt action is necessary.

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Blanks, Blank Mining Books

Constitution and By-Laws

—FOR—

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the

Mining and Scientific Press.

Orders from the interior faithfully attended to.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to the public to warrant publication.

Mining in Idaho.

EDITORS PRESS:—I send you a few items of mining news.

DITCHING AND PLACER MINING.

Dr. Bishop, M. D. (of London,) Dr. Wagner, U. S. A., and Messrs. Thomas Rabney and J. Wilson, have commenced operations for placer mining about ten miles above this city, on a bar called "Granite Bar." They are bringing in a ditch 2½ miles long, and as the ground prospects on the under bank at 1½ cents back to the hill, gradually increasing to 12 cents to the pan, they think they have found good placers.

There is not any doubt but that eventually the bed of Boise River will be worked; but not until miners will be content with smaller pay than they now work for, and will work for $5 a day or less. The gold assays over $16 per ounce, being nearly .800 fine.

VARIETIES LODE.

The parties at work on the Varieties lode at Yuba, have lately come down here, and brought some splendid specimens of ore from that lode; the vein is reported to be rapidly widening, and the owners speak highly of their prospects. The lode is largely owned by Wm. L. Johnson, and the widow of the late L. Whittingham, Esq., and the specimen before alluded to came from their tunnel, I believe.

MILLS.

The Défrees mill is stamping away on Leonora ore, and is reported to be doing well, both mechanically and metallurgically. The Lucy Phillips Company have decided to put their mill up and mine ahead early in spring, and some ore lately taken from the "Atlanta Lodo" is so rich in ruby silver that assays shows the rich streak to be 75 per cent. silver.

YUBA DISTRICT.

A scientific mineralogist, who spent several months of last summer in Yuba, says he will venture it as his opinion, that that district will in three years, discount Owyhee; as the lodes are fully as rich as any at the latter place, and are two or three times as wide; and further, wood and water are abundant. I would not disparage Owyhee, and indeed it would be useless to attempt it; but Yuba and Owyhee together will make Southern Idaho the true "Gem of the Mountains." Our mountains are now snow-clad, but here we have only a little rain, with moderate frosts. ALTURAS.

Boise City, I. T., Dec. 22, 1868.

VELOCIPEDES.—The speed attained by the swifter kind of French velocipedes averages from twelve to thirteen miles an hour; adepts find no difficulty whatever in accomplishing fully fifty miles within five hours without once alighting from their vehicles. A couple of amateurs making a tour through a part of France challenged each other as to which could perform the greatest distance within four-and-twenty hours. One gave in after having accomplished eighty-seven miles: the other went on an additional six-and-thirty miles, making 123 miles in all. On the 21st of last September a party of nine quitted Rouen early in the morning mounted upon velocipedes, and arrived in Paris in time for dinner the same evening, having performed the distance of eighty-five miles, exclusive of stoppages, at a rate of speed averaging between ten and eleven miles an hour. The ascent of any incline greater than one foot in twenty-five is said to be impracticable. When the rider, therefore, encounters a hill of more than average steepness, he has to dismount and lead his velocipede with his hand.—*American Artisan, Nov. 25th.*

THE TELEGRAPH AND THE GOLD ROOM. Heretofore stock houses have employed boys to run to and fro to the Gold Room for the quotations. Now, however, the quotations are simultaneously made known in a hundred different offices. You go into a broker's office, and upon hearing a little noise on the wall, look up, and figures appear telling the price of gold to a fraction at that moment in the Gold Room. In five minutes more, perhaps another fractional figure will appear, indicating another variation in the price, and so on. An operator sits in the Gold Room and touches keys on a board; attached to these keys are wires connecting with the brokers' offices. The vice-president of the Gold Room invented this contrivance. It is said he is to receive $25,000 annually from the hundred offices which have introduced his invention. Its use will do away with the employment of a whole regiment of boys.—*Exchange.*

SEA WATER AS FUEL FOR MARINE ENGINES.—The following is from an article on Marine Engine Improvement in *Engineering*: "If the science of the future can ever accomplish anything for marine engineers, let its first triumphs be these: First, some mode, other than evaporation, of rapidly precipitating the saline constituents of sea water; second, some mode of greatly increasing the heat-conducting activity of the metal or metals of which steam boiler furnaces and tubes are formed. But except by a blind faith, opposed to all that is now known, we cannot hope for either consummation. Although the salt and water which together form sea water are in mechanical mixture only, it is almost as difficult to separate them as to separate the oxygen and nitrogen of the air, which also is but a mechanical, and not a chemical, compound of these gases. We might almost as well hope to decompose water, by an expenditure of power, say one half as great as that which would be derived from the combustion of the resulting hydrogen. Then should we have liquid fuel indeed—a hydrogen field covering one hundred and fifty millions of square miles, or three-fourths of the entire surface of the globe, upon which steam ships could steam everywhere, without coal or stokers. Liquefied hydrogen, from a mile to seven miles deep! Inexhaustible? were it only released from its aqueous bond it would expand into a volume immeasurably greater than that of the entire atmosphere surrounding our planet. And, if that were not enough, it is, like everything else when chemically considered, indestructible, even by combustion with oxygen, whereby it is simply recombined in water, to be again decomposed, the hydrogen again burnt, and so on, *ad infinitum*. A ton of coal, once burnt, is for ever destroyed as coal, although every atom of its chemical constituents survives in other but unavailable combinations. So let those hope who can. We see no way of attaining to this imperial possession of nature, but neither do we see the limits of human discovery."

STEAM FARMING.—When all the advantages of steam are fully understood by farmers we may expect to see it applied on thousands of farms where, thus far, it has never been seen. It will be employed to mix clay and sandy soils, assimilating the texture of hill top lands to that of those in the valleys. It will be employed to pump farm and other sewage to where it ought to be pumped for irrigation, for sheep washing, for stone breaking, and in many other ways. The worthy steam farmer will be a sort of factory owner, and engineer-in-chief, and many of his men will be mechanics, engine drivers, and stokers. The great farms will be almost in a single field, levelled, where practicable, almost like a drawing table or the back of a Shropshire ram. They will, too, like railways, have their own repair shops, and the traveler will never once be out of sight of the farming engine.—*Engineering*.

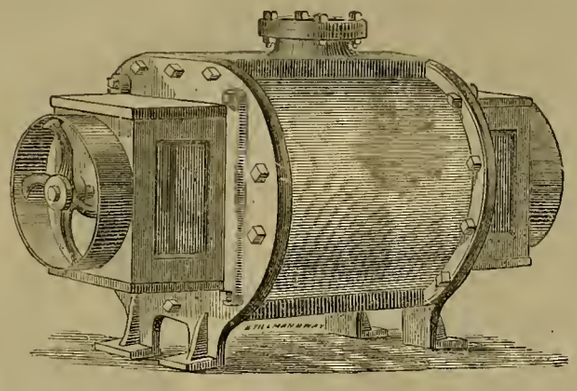
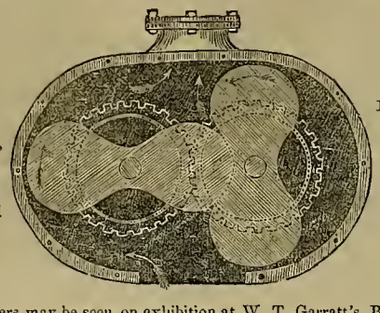
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

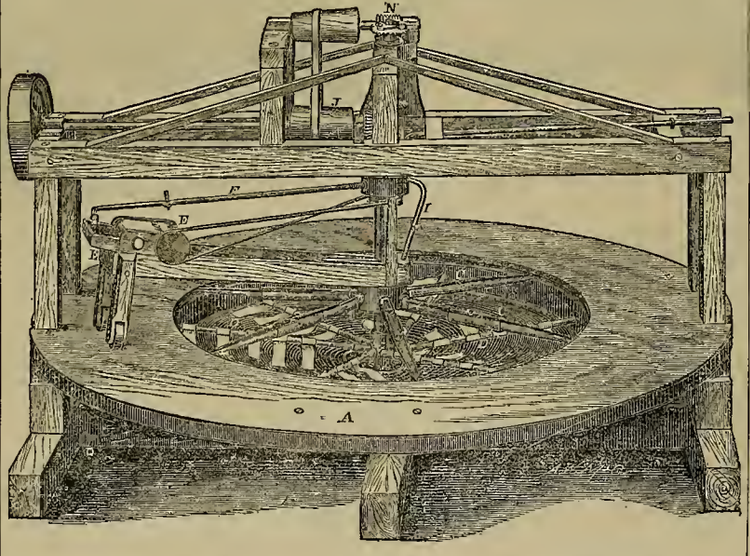
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE, STEPHENS & HARRY.

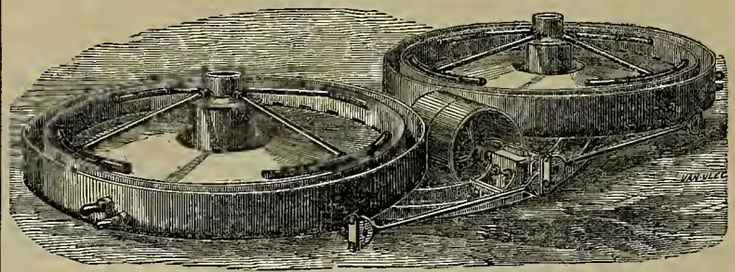
HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

San Francisco, October 19th, 1868.

Mr. M. Hungerford—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

Office of the Oneida Mining Company, Jackson, May 13th 1868

Mr. Morgan Hungerford—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

Big Oak Flat, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pnn, is described in circulars, which will he forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to he appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by Goddard & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 320.—Platinum—as near as can be judged without making an assay—in heavy, whitish steel-gray, ductile, scaly particles, intermixed with a garnet-like sand; from placer mines in Southern Oregon,—presented by Dr. Frey, of Sacramento,—who, it may be remarked in this connection, has one of the most complete mineralogical cabinets in the State, having lately added thereto by the purchase of many lithological and paleontological specimens. Platinum occurs usually in grains, but occasionally in irregular lumps, and is as heavy as gold. It is quite valuable,—next to gold,—on account of its uses in chemistry, being infusible and not attacked by any of the pure acids. Where it can be obtained plentifully, it is well worth saving. It has been found in veins along with gold. Iridium and Osmium, similar metals, are usually found with platinum; in California they are found in many places along the foothills, with the gold, but most plentifully on the lower Klamath.

No. 321.—Psilomelan, or the black silicate of manganese; with Rhodonite, the red silicate, sometimes called manganese spar, but that name is also applied to Diallogite, the carbonate of manganese, distinguishable by effervescence with warm acids. From a newly-discovered locality in Santa Clara County. Presented by W. Frank Stewart, San José.

No. 322.—Red oxide of tin, from Temescal, San Diego County. It is in large solid masses, nearly pure, being accompanied by a little manganese, iron, and quartzose gangue. Average assay of vein matter, 20 per cent. In England, many of the paying mines yield only 2½ per cent. The Temescal mines are believed to be very valuable. Presented by Capt. Wm. Williams, the Superintendent.

No. 323.—Tin ore, from Mexico, consisting of red oxide, intermixed with copper pyrites. Presented by Dr. Jones, of Murphy's, Calaveras County.

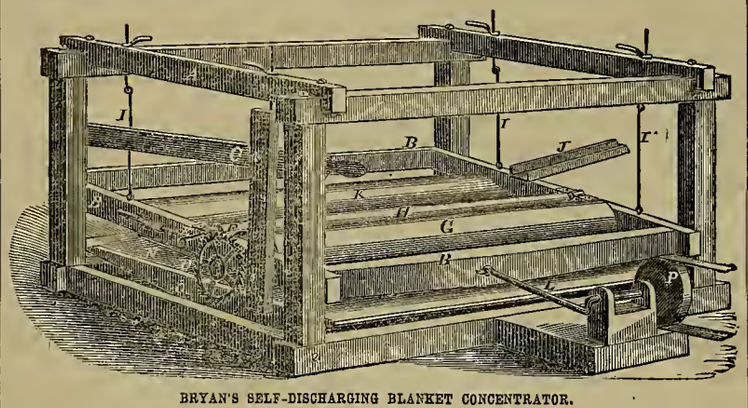
No. 324.—Specular iron ore, partly micaceous. Obtained by A. B. Butler, in Calaveras County.

No. 325.—Olmstead's paint, of the color designated as Sienna, from Olmstead's Mills, Sonoma County. Probably oxide of iron mixed with pulverized rock, or earthy matter.

Bryan's Self-Discharging Blanket Concentrator.

The utility of blankets for concentration being well established, numerous suggestions have been made to overcome the great objection which is justly urged against their common use,—that of the cost. A quarter of a mile of blankets will undoubtedly retain the pure sulphurets and amalgam very satisfactorily; but the blankets are soon decayed, and will have to be renewed. They are used, accordingly, only to a limited degree, where the ores are such as to warrant the expense incurred.

The waves of the ocean have a peculiar effect upon substances of a different specific gravity, which, attracting the attention



BRYAN'S SELF-DISCHARGING BLANKET CONCENTRATOR.

of Mr. John M. Bryan, one of the old adventurers of Gold Bluffs on the Klamath coast, led him, probably in an interval of discouragement at the perversity and scarcity of the magnetic sand of the sea which had in its black grasp so many a golden fortune, to betake himself philosophically to a study of the principles of the statics and dynamics involved. Subsequent experiments in the foot-hills—Grass Valley—led him to devote special attention the concentration of auriferous sulphurets, with a view to improving, as far as possible, upon the ordinary appliances in use. He adopted the blanket method as the best, but modified it to save costly material, by using one blanket only, in the form of an endless belt, which revolves on rollers in a frame as seen in the accompanying engraving. The idea of the shelving sea-beach, and of the succession of rolling breakers, which abides in the memory and imagination of all who have visited Gold Bluffs, never left him until it was developed into this practical application. But the operation and substantial merits of Mr. Bryan's concentrator will be best understood by reference to the engraving.

Instead of woolen blankets in this machine, two thicknesses of canvas (quilted together to prevent sagging and irregularity of surface) are used to form the endless revolving belt.

The pulp, from the stamp mill, flows down the spout J, upon the upper end of the blanket surface, which is extended like a belt between the rollers (G and K), and indented by the smaller roller H, running on the top of the blanket close to G, so as to make a kind of trough beyond H, with a shelving bottom (K). The slope of the rollers and blankets is towards the left, being adjustable to suit the ore by the screws and rods I, I, by which the entire blanket and roller arrangement swings in the wooden frame A.

Now an oscillatory motion is given to the swinging blanket frame B, B, by means of the pulley P, and rod L. This causes the pulp and accompanying water at K to ripple down along the shelving channel in little wavelets, towards the point of discharge of the tailings E. For every oscillation of the blanket frame, the pawl F catches in a new tooth on the ratchet wheel D, revolving the rollers, and so causing the blanket channel, and upper surface, to move from us, and to carry the heavy particles up the shelving slope K, and over the farther roller, into a tank underneath, N, which is filled with water to wash off the sulphurets, which are deposited in the tank. The heaviest and best quality of sulphurets will be found at the upper end of the tank under K.

We have, here, a blanket washing, combined with an operation resembling that of the Ruttinger percussion table, though the principle is not the same, this being more of shaking than of a percussion table; the motion of the heavy particles in the Rittinger table being the reverse, or towards the force of percussion, as is the case in working with a hand spoon. Mr. Bryan tested this machine in the ravine below the Banner Mine, Grass Valley, and says it will give the best results of any concentrator yet tried on the coast.

Other revolving blanket concentrators have been in use, which were invented by Mr. A. Woodside, W. A. Hedger, Smith, Hinkle, and Mosheimer, and others, which feed and empty differently, most of which do not make use of the principle of oscillation. An application has been made for a patent for this device through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Further particulars may be obtained from Mr. Bryan, Lincoln, Placer County.

WHITE PINE is still a center of attraction to speculative miners, and to the adventurous in general. Numerous capitalists have sent, and are still sending agents thither, with purposes varying according to the style of operation and character of the parties. Lawyers and go-betweens are busy, and a few valuable mines have changed hands. The bullion product is not increasing at present; the prices are high, the snow is a foot deep, the weather cold at White Pine,—but the excitement and interest continue unabated, eastward as well as westward. A town is expected to grow up there equal to Virginia City; but the permanency of the deposits or of veins in depth, is canvassed intelligently only between lawyers and experts, while actual developments underground, which should have determined the question pretty positively before this, are kept quiet, for speculative reasons. We have furnished our readers with the essential data, and repeat confidently that this is by no means the gambling question that some would make of it. The district has a set of mining regulations—a series of resolutions adopted at a miners' meeting—which allow a claim of 200 feet on the lode to each locator, and 200 feet additional for the discoverer. The claim follows the lode.

A map of White Pine District and of eastern Nevada, is shortly to appear, accompanied with published facts of interest and value to the expected stream of eastward travelers in spring.

The new stage road from Elko, 460 miles from Sacramento, on the Central Pacific Railroad, to Hamilton, was opened on the 8th inst. The distance is 125 miles, and the road a good one, lying partly through Newark and Huntington valleys, which afford abundance of water and forage. Huntington and Smith creeks flow through these valleys, and form the North Fork of the Humboldt River. We quote the list of stations on the route, at each of which fresh teams are taken:

Hamilton to Pancake Mountain	17 miles.
Newark, (site of a quartz mill)	11 "
Thomas' Station	12 "
Cold Springs	11 "
Jacob's Well, (on overland route)	9 "
Winnie Ranch	13 "
Robinson's	17 "
Smith's Creek	10 "
Sheppardstown	10 "
Elko	15 "

The miner, the carpenter, the blacksmith, the capitalist, the boarding-house keeper, and the gambler will do well for some months at White Pine; but persons of other professions will run the risk of finding no employment until the community becomes a settled one.

WE HAVE NOTICED on exhibition at Sawyer & Williams', No. 439 California street, some rare specimens of copper, gold and silver ores, from the Sance and Giantess mines, located on the Gulf side of the peninsula of Lower California, about fourteen miles from the Bay of San Bruno,—also a map of the country and drawings of the mines, both of the surface and underground workings; also the Territorial Surveyor's survey of the mines and land, comprising over sixty square miles. These mines and lands are for sale. See advertisement in another column.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Account of Famous Mines in Mexico.

BATOPILAS, Chihuahua, Mex., Oct. 24th, 1868.

EDITORS PRESS :—I left the very interesting mining place of Guadalupe y Calvo, about September 8th, and passing through a highly promising, yet almost entirely unknown country, teeming everywhere with silver lodes and prospects of gold, and finally arrived here on the 26th of the same month. Since then I have made this my headquarters, and dedicated my time exclusively to a very careful inspection of the district and its dependencies, the result of which I will now lay before you.

All along during my travels through these northwest States of the republic, I had frequently heard accounts about this ancient mining region, yet I confess I had almost invariably set them down as exaggerated and highflown illusions, such as the native population are but too apt to entertain credulous foreigners with, or partly believe in themselves.

FABULOUS REPORTS.

The reports of the fabulous masses of pure native silver which the Batopilas mines are said to have produced, seemed like fairy tales, or to float like vast silvery clouds before their imaginative visions; yet I have now become convinced that a great deal more of sober truth was covered by them, than I had been willing to give them credit for. In fact, after having seen the most of the famed mining districts of Europe, and the southern and central part of our own continent, as well as Mexico, I am convinced that I am now in a region more wonderful than any of them.

The data I have been able to gather about its former history, so far as I hold them to be reliable, are the following, partly drawn from a very valuable statistical book on the State of Chihuahua, written by Don Juan de Escudero, partly from accounts received by a gentlemen well known and respected everywhere in these States, Mr. George Le Brun, at present director of the mint in Alamos, and from other written documents and verbal communications.

BATOPILAS

is situated in the mountains near the southeastern corner of Sonora. The mines of Batopilas were discovered about 200 years ago, when it is said an Indian swimming the river during a tremendous freshet, was carried down the stream by the current and accidentally landed at a place on its left bank, where the water had carried away a large piece of rock forming one of the walls of a vein, leaving open to the sun's rays a vast mass of pure metallic silver, white almost as snow. This circumstance created the name given to it of "La Nevada," meaning the "snow white." The report of this discovery spread, and soon the hitherto quiet and unknown valley became the seat of a lively mining industry.

The town is in the heart of the "Sierra Madre," which crosses the State from N. to S., sending out rugged spurs in every direction, yet strictly speaking, forming an immense, high table land, whose altitude here attains to 8,000 or 9,000 feet above the ocean. The climate is salubrious; in greater hights, the finest any where to be met with. The average heat down in the valley, in the summer or rainy season, is not over 85°, while in winter, the thermometer hardly ever falls below 45°; snow only occasionally being seen for a few days on the most elevated mountains, while the vegetation in the valley and up to 3,000 feet above, remains green all the year round.

THE VALLEY

winds itself as a narrow rent along between tolerably steep mountains, whose greatest altitude may reach to 3,300 feet above it. Its main extension may be set down to seven miles from S. E. to N. W., with various side valleys emanating therefrom.

The vegetation consists of a variety of thorny shrubs and immense cactus of a grotesque form, the tops and north sides of the hills overgrown with oaks and forests of gigantic pines, while extended grassy slopes provide a magnificent pasture for animals.

A creek, or as it is here styled, "El Rio," runs in its rocky bed with never-failing water of the most beautiful crystal clearness, and of more than sufficient power to drive several ore mills—"hazieudas."

Along its right, or western bank, under the very shadow of the overtopping mountains, stretches itself, the

TOWN OF BATOPILAS,

built up in the old Spanish style of adobe, or sun-dried bricks; houses of one, seldom two stories in hight, with flat roofs, occupying every available place, barely leaving room for a narrow road. The population, which for a number of years after the end of the last great "bonanza" had dwindled down to a mere handful, and only slowly begun of late years to increase again by the newly started enterprises, may at this day be safely set down at between 3,000 and 4,000, drawn hither by the return of the era of a bonanza, whose wonders or extent it is utterly impossible to foretell, but which bids fair to outshine by far all the former historical ones.

THE NECESSARIES OF LIFE

are all brought in by pack mules from the towns situated on the rich plains, extending from the foot of the Sierra to the far off seashore, and vary their prices according to the result of the seasons. The chief staples of consumption are corn, sugar, beans, salt, tallow, lard, and the various classes of dry goods. A portion of the former, as also the beeves, are raised and sold by the semi-civilized Indians of the "Tarahmari" tribe, inhabiting the Sierra.

THE DISTANCE

from Batopilas to the two principal towns from which it has naturally to draw its supplies, are, to *Fuerte*, about five days' travel in the saddle, and *Alamos*, about the same, the half of which is over mountains. Thence clear down to the seacoast, a most beautiful natural wagon road leads over a slightly undulating, very fertile country. Mazatlan, from the former, and Guaymas, from the latter place, form the respective seaports, whence easy and regular steam communication with San Francisco twice a month can be had.

The distance to the city of Chihuahua, the capital of the State, is about seven days' travel in the saddle, in a northeasterly direction.

RICHES.

The riches which the various mines of the district have given in former times, can not now be accurately stated, since, by a conflagration, which destroyed the entire official documents in the year 1827, relating to the matter, were lost.

It is however known, that as a duty of 20 per cent. on the silver taken out from 1785 to 1789, and actually paid into the royal treasury at Chihuahua, the sum of 922,000 marks, or $7,376,000 were registered, showing thereby a result of production of $36,880,000; to which a reasonable amount must be added that was never entered.

A very few scattered documents only exist relating to the former condition and produce of two or three of the principal mines.

VEINS.

The number of veins which furrow this district it is impossible to calculate. I can only say that in no part of the world have I ever seen anything approaching to it. While those most known may reach the number of 100, those best known or not outcropping, will surely go far over 500, their general course being from north to south with more or less deviation.

ORES.

The ores consist principally, and in some mines entirely, of the very richest native silver, bright as it comes from the assayer's cupel, and in the most wonderful and beautiful shapes and combinations; their value ranging from the poorest, of $80 to the ton, to $20,000 and $30,000. The matrix of the lodes consist of calcspar, but very few showing quartz, as such, and these latter ones have not yet been sufficiently prospected to satisfy me as to their worth.

GEOLOGY.

The mineral country through which they run, is composed mostly of "diorite," while granite shows only in a few higher localities, and stratified rock, merely in two or three points to a limited extent. A majority of the lodes seem to concentrate in a famous hill, known as the Cerro de Animas, which alone may hold more than 300 or 400; also in the Cerra de San Antonio, and Cerro de la Descubridora.

BONANZAS.

Among these mines that in former times are known to have given great "bonanzas," are principally mentioned the Nevada, the Dolores, the Pastrana, San Antonio, Carmen, Martinez, Roncesvalles, Arbitries, Cata, Vallinas, Descubridora, San Pedro, Baltazar, and others too numerous to mention.

THE PRICES OF LABOR

in the mines average six bits for a day's work, of two blast holes of sixteen inches each, and four hits per day to the boys carrying out the rubbish from the mines, while a foreman receives from $8 to $12 per week.

THE BENEFICIATING

of the ores has hitherto exclusively been done by the *Patio Process*, the grinding being by the old fashioned Mexican *arastras*, driven by water power. Of late, however, the greatly increasing produce of the mines demands different facilities for working up their ores, and consequently several of the American companies at work here have sent off for improved machinery.

[To be continued.]

[Written for the Mining and Scientific Press.]

Facts About the Giant Powder.

EDS. PRESS :—As a matter of some interest to the owners of mines, I beg to lay before your readers the following facts connected with the use of Giant Powder in the Oakes & Reese mine, in Hunter's Valley, Mariposa County, belonging to Messrs. Robinson and McAllister.

We have used the powder entirely since last April. In its use, the steel consumed is of uniform size, ¾ inch octagon. Hammers (short handles) weighing 3½ pounds. The country rock is hard and tenacious. The veins of quartz are narrow, varying from ten inches to three feet, generally running from one foot to twenty inches in width, with little or no gouge.

The system which Mr. Cassel, superintendent of the mine has introduced, and which can only be used to advantage with Giant Powder, is to pay the miners by the foot in depth of hole drilled; the miner doing no blasting, nor does he handle any rock, his simple duty being to drill holes where instructed.

The underground superintendent or head blaster,—one for each shift,—instructs the miner where to drill a hole. When the hole is drilled to the depth required, the superintendent measures it and takes a memorandum of same, and sets the miner at work elsewhere. As soon as the hole is measured, the blaster loads it with from two to two and one-half ounces of loose powder, fills the hole with water, covers it, and leaves it until the men leave the mine at time of shift. As soon as the men have left the mine, the blaster with his fuses, with cap or exploder attached, makes his round, and removing the cover from the hole, drops the fuse into the hole, works the exploder into the powder, which is quite soft, fires the fuse, and in a few minutes will explode all the holes drilled during the working shift. As soon as the explosions are made, the rock men and skip men clean away the *debris* which may be in the way of drilling new holes, and when the men again come into the mine, there is work for them ahead, in drilling. A blast is only fired when the men are at work in the mine, when it becomes necessary to remove material. Thus it will be seen, no time is lost in blasting.

My experience since April last, leads me to know the following facts in use of Giant Powder, as against gunpowder:

First—The amount of work which can be performed in a given space, in a mine, is nearly double.

Second—The consumption of steel is about one-half.

Third—The consumption of hammers is about one-half.

Fourth—The consumption of candles is about one-half.

Fifth—The width of the drifts or stopes is only about one-half, requiring so much less material to be removed or hoisted from the mine.

Sixth—The mining timbers are of shorter lengths.

Seventh—The ore raised from the mine is broken by the force of the powder so as to require less spalling for the mill.

Eighth—The progress of the work in the mine is expedited at least 40 per cent, and in wet mines, the progress is increased fully 50 per cent., if not more.

The miners pay roll for the mine during October, was only $2,429.03; and during this time this force not only kept the 12-stamp mill busy day and night, but the yield of ore from the mine has so increased that another battery is now being erected of four stamps more,—sixteen stamps in all. These sixteen stamps could not be kept employed from the mine with common powder, short of a pay roll of $8,500 to $9,000 per month. Thus much for the use of Giant Powder for the owners of mines. Now comes the advantage to the miner.

The miner never incurs any danger from use of the powder, as we have never met with an accident in its use, and is never injured in the hands from a careless striker; and when the miner is used to this powder, and understands its peculiarities and great safety, he returns to the use of gunpowder with much reluctance. It may be as well to state here, that I never hear of any trouble caused by sickness or disease in the use of this powder in the mine.

So far as the miner is concerned, he can earn more money in using the ¾-inch steel and small hammer, than in any other way. It is true he must earn his money, and is not paid by the day. The price paid in the O. & R. mine is 37½ cents per foot of hole drilled. In October, there was drilled 6,476¾ feet of hole, costing $2,429.03. The following list will exhibit the amount earned by the miners most expert in use of single hammer drills, in October, twenty-seven working days:

P. Beical	$130.20	H. Latty	$97.36
L. Boivin	124.33	F. Gill	94 62
J. A. Wilson	131.77	J. Sastrade	90.70
B. Kendall	103.77	J. Fortuna	94.56
S. Cox	122.25	H. Boyle	91.77
S. Uran	130.74	J. Martin	90.49
B. Picard	104.58	L. Battiola	84.93

and many others, ranging below the above amounts, falling short, either because of not working full time, or from not being expert in use of single hammer. Still, any system of mining, where a miner willing to work can earn as high $131.77 per month, of twenty-seven working days, must inure to benefit of the miner, and particularly so when the mine owner is willing to pay such wages. One thing is certain, that with Giant powder and the use of small steel and hammers, the miner must earn his money, and cannot shirk his work, as is too often the case under the old system of mining.

The following are some of the localities where this powder is being used:

1—At the Oaks & Reese mine, Hunter's Valley, Mariposa County. (Property of L. L. Robinson and Hall McAllister).

2—At the Josephine and Pine Tree mines, Mariposa estate.

3—At the San Jacinto tin mines, San Bernardino County.

4—At the Zapata silver mine, Los Angeles County.

5—At the Ophir shaft, Virginia City.

6—At the San Marcial silver mine, Sonora, Mexico.

7—At the Rattlesnake quartz mine, Yuba County.

8—At the New Almaden quicksilver mine, (recently mentioned in the PRESS), and in many other localities.

It has also been used to advantage by Captain Lambert and others, for whaling purposes on the southern coast. K.

THIERRY'S WATER VELOCIPEDE, on Lake Enguien, Paris, is constructed on the principle of the twin ship tried some years ago on the Thames, the motive power being placed in the middle instead of on each side, as in ordinary paddle steamers. A pair of hollow water-tight pontoons, about twelve feet long, ten inches wide in the thickest part, tapered to a point at each end, are fastened together about twenty inches apart by transverse bars near the extremities. In the center is placed the seat, rising about two feet above the water, and paddle wheel, three feet in diameter and eight inches broad, provided with sixteen floats, the axle turning on stout iron uprights, and rotary motion being obtained from cranks worked by the feet.

Mechanical.

Belts.—Broad thin belts are better than narrower thick ones. "When bent round the circumference of a wheel the outer parts of the belt are distended, the inner parts relaxed; and supposing the section of the belt to be rectangular, the amount of force expended in making these changes is proportional directly to the breadth, to the square of the thickness, and inversely to the diameter of the wheel."

A rubber belt should become glossy upon its face by use. "As soon as it begins to glaze, you may be sure you will have no trouble with it."

"The slack side on top with large pulleys at high speed, is undoubtedly the true philosophy of transmitting power by belts."

"Belt pulleys should be made slightly convex, in a ratio of half an inch per foot of breadth."

The *hair* side,—not the *flesh* side,—of the belt, should be next the pulley. It will transmit one-third more power than if reversed. Moreover, it will run more steadily, and will not wear ont.

"A leather belt ought to have a velocity of at least 1,500 feet, and not more than 2,000 feet, per minute."

Pulleys for round belts should have a groove of V,—not U,—form.

The above notes are a part of a collection of such made from various mechanical journals, at various times, by the *Journal of the Franklin Institute.*

Bessemer's Last.—The recent improvements in the manufacture of refined iron, and of malleable iron and steel, which have been made by Mr. Bessemer, consist in injecting into molten crude iron, or re-melted pig iron, or other carburet of iron, jets of fused nitrate of soda or nitrate of potash, or other fluid substances which are capable of evolving oxygen when brought in contact with fluid iron; such substances being used alone or in conjunction with oxides, peroxides, or silicates of iron or manganese. The jets are projected downward at any angle from tuyeres, the orifices of which are above the level of the fluid iron. The iron to be operated upon may be contained in those vessels known as "converters," generally employed in the Bessemer process, or in a cylindrical chamber lined with fire-brick, or other refractory material, or in the hearth of a "finery furnace," similar to those employed in refining pig iron for puddling.

How an Axe is Made.—A correspondent of the *Scientific American* gives a description of the Collinsville (Ct.) Iron Works, from which we clip the following on axe-making: A bar of heated wrought-iron is cut up into chunks, and an eye is punched into it by the same movement; then it goes into the bitt shop, where a piece of steel is clasped and welded to the iron and drawn to the edge, then to the temperers to receive their delicate manipulation; then into the grinding shop; then to the polishing shop; then to the blacking room, where the asphaltum is put on to protect the head of the axe; then to the packing-room. And while passing through each one of these processes, the instrument is handled by a different professional inspector, and if there is a flaw, or if the temper is faulty, back it goes to the beginning.

A New Railway Brake.—At a recent meeting of the London Polytechnic Society, a newly invented brake was exhibited, which consists of a pawl taking into a rachet on the axle of one of the pairs of wheels, and which can be readily applied by the brakeman, or taken off when not wanted. It was suggested at the meeting that the action for regulating the pawl might be connected with the coupling chain, and thus be made to fall into gear when breakage happened. The brake would then be self-acting.

Wheel Molding Machine.—George L. Scott, of Manchester, Esq., at a recent meeting of the Institution of Mechanical Engineers, in Birmingham, exhibited a machine for molding toothed wheels, not only with greater accuracy than is attainable by patterns, but in unlimited variety as regards size, pitch and form of teeth. The machine is portable, cheap, and self-contained; being capable of ready application in any part of the foundry. "The whole machine,"—says the London *Artizan*,—"is carried upon a center pillar, which fits into a socket in a cast iron pedestal, sunk in the floor of the foundry below the depth required for molding, and fixed truly vertical; several of these pedestals are placed in convenient situations in the foundry floor, so that the molding machine can be employed successively upon the molding of different wheels. The center pillar of the machine carries a horizontal arm, capable of adjustment radially to suit the diameter of the wheel to be molded; and the extremity of the arm carries a vertical slide, on the bottom of which is fixed the pattern for molding the teeth of the wheel. This pattern consists of two teeth only, for molding one space only at a time, whereby absolute equality is insured in the size and shape of all the teeth in the wheel. After molding each tooth, the pattern is drawn from the sand with perfect steadiness by the vertical slide of the machine; and by means of a set of change wheels and a worm wheel keyed upon the center pillar, the radial arm is turned round through a space equal to the pitch of the teeth, and the pattern is then lowered again for molding the next tooth of the wheel. On the completion of all the teeth, the molding machine is lifted off the pedestal by the foundry crane, the cores for the arms are put in their places, and the top box put on, ready for casting; the flat surfaces of the top and bottom boxes having been already prepared, before the molding of the teeth was begun, by means of strickle boards of the required shape, working round a center pin fixed in the same pedestal which afterwards carries the center pillar of the molding machine, so as to insure strict accuracy for the whole of the work."

Chilled Cast-Iron Wheels.—*Engineering* copies several letters from railway men, all of which give the decided preference to cast-iron wheels over those of wrought iron. One of these letters, by George E. Gray,—late Chief Engineer N. Y. Central Railroad,—says that experience has demonstrated the superiority of cast iron wheels *in all particulars.* They will save more than their cost in the increased length of time for which they will wear, and they do not break. Mr. G. writes: "Trains are often run at the rate of sixty miles an hour for many miles together, and this over far worse tracks than we ever found in England or France. This company have tried the best wrought-iron wheels made in England, and have found the cast-iron the cheapest, the most durable, and equally safe."

The Mississippi Bridge.—*Engineering* describes in full, and illustrates in its usual splendid style, the noble steel-arched bridge across the Mississippi at St. Louis, designed and already commenced by Mr. James B. Eads, Chief Engineer of the Illinois and St. Louis Bridge Co. "No work at present in progress exceeds it in interest." The span of the center arch is 515 feet.

Alloys of Steel with Platinum.—These alloys, when both metals are in a state of fusion, are perfect in every proportion that has been tried. Equal parts by weight form a beautiful alloy, which takes a fine polish and does not tarnish; the color is the finest imaginable for a mirror. The specific gravity is 9·862.

The Phosphate Rocks lying near Charleston, South Carolina, are supposed to be of immense value, inasmuch as they contain the element of a valuable fertilizer. It is stated that half a million dollars have been received in Charleston since last spring from the sale of the rock, and from subscriptions to the stock of companies. Apatite and other minerals containing phosphor, are not uncommon, and are found all over the globe.

Scientific Miscellany.

Recent Astronomical Discoveries.

Mr. J. Norman Lockyer, F.R.A.S., who communicated a paper to the Royal Society some two years ago, upon the application of the spectrum analysis to the determination of the solar spots, made on Nov. 5th, certain observations, which he laid before the Royal Astronomical Society at a recent meeting,—and which are thus reported by the *Engineer:* "Upon turning the instrument to the limb of the sun, he was surprised to see, directly he looked through the eye-piece, a phenomenon which somewhat puzzled him. He saw not a long line, but a short one, which appeared to indicate a small prominence, or a loop of a large one. Yet though he swept the limb of the sun for some time, for a distance of perhaps 200,000 miles, he could find no large promiaence, but still saw the short lines. He concluded, therefore, that they came from a gaseous envelope of the sun altogether new to science. He obtained the same results in every part of the limb of the sun, except where there were prominences. Thus is indicated a new envelope five or seven or eight thousand miles in hight, extending all round the sun. There is no great difference in its thickness at the poles or at the equator. The reports from India give three lines as those most generally seen. It was the same with himself. But when the action is excessive, he sometimes saw a fourth line, near the *c* of the scale. The spectrum of the sun itself is always visible in the instrument at the same time as the spectrum of the promiuences."

The same journal gives a letter from Dr. Jausen, who was sent out to India to make observations on the eclipse of the sun, in August last, and whose attention was attracted to the same peculiar "promineaccs" referred to by Mr. Lockyer, while making these observations at Guntour. His letter is to the Minister of Public Instruction, at Paris. We quote a portion of it:

"Immediately after the totality, two magnificent protuberances made their appearance; one of them, of more than three minutes in hight, shone with a splendor which it is difficult to imagine. An analysis of its light showed me directly that it was formed by an immense columu of incandescent gas, principally composed of hydrogen. The analysis of the regions surrounding the sun, where M. Kirchhoff places the solar atmosphere, has not given me results conformable to the theory prescribed by this illustrious physicist. These results, it appears to me, should lead to a knowledge of the real constitution of the solar spectrum. But the most important result of these observations, is the discovery of a method of which the principle was conceived during the eclipse itself, and which will allow of the study of protuberances and of the regions surrounding the sun at all times, without its being necessary to have recourse to the interpositioa of an opaque body before the sun's disc. This method is founded upon the spectral properties of the light of the protuberances—light which resolves itself into a small number of very luminous pencils corresponding to the obscure rays of the solar spectrum."

The Mississippi Delta.—Sir Charles Lyell, at a recent meeting of the Geological Society of London, said that with regard to the delta of the Mississippi, the data on which he argued had considerably altered since first he wrote on the subject, inasmuch as recent calculations had doubled the estimated volume of water flowing into the sea, and thus it was capable of producing the same effect in half the previously calculated time. The progress of the delta at any spot was of necessity variable, as the position of the mouth changed. The American engineers had allowed only forty feet as the depth of the fluviatile deposits, whereas from boring Sir Charles had concluded it to be at least 500 or 600 feet. There was now reason to suppose that it was much more, possibly as much as 1,500 feet. This being the case, notwithstanding the amount of work done by the river being doubled, his calculation as to the time required for the formation of the delta might not after all be so excessive.

Solid and Liquid Fats.—Dr. Dobell, of the Royal Hospital, after remarking, in the London *Chemical News*, that there is a singular absence of precise knowledge as to the relative properties of solid and liquid fats, says: "The fatty bodies obtained from warm-blooded animals are generally solid at ordinary temperatures, whilst those from fish and from cold-blooded animals are liquid. And when we consider the high melting points of the solid fats as compared with the temperature of the body in warm-blooded animals, it is evident that the fat in them would be solid at the temperature of their blood, but for the mixture of olein, by which the melting point is reduced. Therefore the solidity or fluidity of the fat in living animals is determined by the proportion of olein which is able to be mixed with the stearia, palmitin, and margarin in each individual; and we are forced to conclude, either that it is of no importance whether the fats of the body during life are in a solid or liquid state, or that it is important at in what proportion the olein, stearia, etc., shall be combined."

Dr. Dobell closes his article by submitting to chemists, for experiment, the following questions as important in reference to the determination of the quantity and quality of food necessary for animals under different conditions:

1. What is the relative facility for oxidation of the solid and liquid fats at similar and at different temperatures?
2. Is the facility for oxidation inversely as the melting points?
3. Is it the same for all fats at their melting points?
4. After the melting point of a fat has been attained, is the facility for oxidation affected by further increments of temperature?
5. Is there a temperature at which fats cease to be oxidizable, and, if so, what relation does this bear to the melting point in each instance?

Pascal versus Newton.—About a year and a half ago, the scientific world was considerably excited by the claims of M. Chasles, in favor of Pascal as the discoverer of the law of Universal Gravitation. M. Chasles insisted, before the French Academy of Sciences, that Newton owed all his knowledge to Pascal; and produced in proof, a number of newly-discovered letters from Pascal to Newton, from the mother of Newton to Pascal, and from various other persons,—among which were some from Galileo. M. Chasles positively refused to give any information in regard to the source whence he drew these letters. They were one after the other pronounced forgeries, by a committee of investigation appointed by the Academy; and the general belief was that M. Chasles himself had been deceived.

The excitement,—says *Scientific Opinion*,—upon the subject, has already died away; but we recal the facts in order to give a statement from a recent number of the *Milan Gazette*, which is to this effect: "In examining some papers of Galileo at Florence, a letter was found addressed to a French *savant*, in which Galileo excuses himself for not having replied earlier, on the ground 'that he could not find readily at Florence any one who could translate a French letter into Italian.' From this it is clear that Galileo did not know French, and therefore could not have written the letters attributed to him."

Explosive Agents.—Prof. Wurtz says that there is something more than outside pressure which determines the manner in which different compounds explode. Nitro-glycerine, he says, belongs to a class,—of which common gunpowder is a member, but fulminates are *not* members,—which seem to require an *internal* molecular disturbance to excite explosion, and are not affected with certainty by *external* mechanical force. Their mode of explosion may be compared to an immensely rapid and intense fermentation. Prof. W. promises a paper *in extenso* upon the subject, giving some very curious experiments and observations of his own, made some years since.

Work at the Foundries.

The machinery for a number of sawmills has been occupying the Miners' Foundry to some extent. A large one for Hanson & Co., at Puget Sound, is to have a capacity of 60,000 feet a day; having a double circular saw, and a light gang or "pony" for resawing. Another sawmill for the uorth coast redwoods, is in hand, to the order of the Garcia Lumbering and Fluming Co., Garcia Creek (this side of Cape Mendocino), of which tbe capacity is to be 30,000 feet a day. Still another is for Smith & Doherty, Trinidad, Humboldt Couuty, which is also to have a capacity of 30,000 feet a day.

A 10-stamp quartz mill for White Pine is being put together for A. Staples.

Tbe new four-cylinder engine invented by Mr. Howland, (referred to in another column) is a very interesting and curiously working piece of mecbanism.

To obtain water at the Miners' Foundry an artesian well is being bored, which has attained a depth of 190 feet. It is expected that water will be met with at almost any time now, since at Hinckley's, and at Selby's sbot works, it was reached at a deptb of only 175 feet. The strata cut through were, 1st, sand; 2d, clay; 3d, another layer of sand; 4th, a stratum of clayey gravel, the stoues being very small and angular, showing little or no evidencos of water wearing.

At the Ætna Works there is being made a Hanscom jaw crusher, for the Stow Pavement Company. The object of tbis is to break up rocks to such a consistency as to answer in the place of gravel, for filling the cells, tbat being fonnd both cheaper and hetter tban gravel. Three of Varney's pans and two settlers, witb the necessary shafting and gearing, bave heen made for the San Marcial Silver Mining Co., Mexico, of which Bandmann, Neilson & Co. are the agents. A velocipede of a peculiar pattern is under way. A 30-inch Tyler turbine has been made for the Mariposa Estate, to the order of J. G. Rice, Superintendent, intended to drive one of their mills; a Scotch reaction turbine, which was found to require the whole river as motive power, being replaced by it. Quite a nnmber of Carvalbo's steam superheaters, and of Bemis grate bars for the burning of Mt. Diablo coal, are being made bere constantly, to order.

At tbe Fulton Foundry, Messrs. Hinckley & Co. are building for H. B. Tichenor & Co., the macbinery for a steamboat whicb is to run from San Pedro, the port of Los Angeles, to Wilmington, tbe terminus of the Wilmington and Los Angeles Railroad. Tbe railroad is twenty-one miles long, and is now nearly all graded, so that the road may be expected to be open soon and in operation. The engine has an 18-inch cylinder and five feet stroke. Another engine is beiug made here for Hanson & Co's new sawmill at Pnget Sound. A large double circular sawmill complete, is being made for C. F. Ellsworth, of Chico; aud another for Mr. St. Ores, Gualala, Mendocino County, whicb is to have a capacity of 18,000 feet a day. Fifty new bydrants for the city are being made, slightly different from the old ones, having two or more joints. Amongst tbe smaller johs are steam pumps for Mr. Tichenor's steamboat, a velocipede embodying original points, etc.

Mr. Brodie, tbe foreman at tbis foundry, has invented a very useful "revolving steady-rest," which will prove of great value to irou turners. Any kind of irregular piece of iron, whether corrngated, ribbed square, or three-coruered, can be fastened into this rest, and as the rest itself revolves, the ends, or a journal, crank pin or tbe like, can be turned off at ouce, and anywhere.

A Tin Concentrator bas been made in this city for the San Jacinto (Temascal) Mine, and fifteen tons of ore are on the way to be used in a trial. It is a moving blanket, on rollers, and a current of clear water is made to meet the ore,—wbich is finely pulverzed, either in a stamp mill, or revolving crusher.

New Incorporations.—Articles of incorporatiou have heen recently filed in the County Clerk's office in this city as follows:

Oneida Mining Co.—Amador County. Jan. 6th. Capital stock, $640,000; 3,200 shares, $500 each. Trustees: James Morgan, C. F. Fargo, Geo. W. Beaver. J. D. Fry and Benjamin F. Sherwood.

Vallejo Building Association.—Solano County. Jan. 6th. Capital stock, $100,000; 100 shares, $1,000 each. Trustees: Jno. B. Frisbie, Chas. Wheeler, Francis Avery, Henry W. Spencer and W. F. Rulofson.

Coney Mining Co.—Amador Connty. Jan. 6th. Capital stock, $300,000; 30,000 shares, $100 each. Trustees: H. H. Bigelow, Leonard Coney, J. W. Garhwiler, George H. Bigelow and S. Heydenfeldt.

Irish American Mutual Association. San Francisco. Dec. 30th. Directors: Edward Moran, Wm. O'Connell, John A. Ahern, A. E. Mylott, Charles O'Neil and Daniel Shehan.

Hibernia Provident Association.—San Francsico. Dec. 31st. Trnstees: J. R. Kelly, Thos. Golden, Daniel Murphy, John Kelly, James G. Malley, Thos. Finn, B. J. Shay, F. S. Wensinger, Peter Dempsey, James McNamara, James M. Sharkey, Frank Cassin, P. H. McGovern, Michael Gnerin, and James R. Deane.

Douglas S. M. Co.—Lander County, Nev. Jan. 11th. Capital stock, $320,000; Trnstees: J. L. Blaikie, E. H. Shaw, C. E. Convis, S. W. Backus and A. Meyer.

Hidden Treasure Co.—White Pine, Nev. Jan. 4th. Capital stock, $800,000; 8,000 shares, $100 each. Trustees: F. G. Smith, C. W. Fox, E. M. Hall, Hill Beachy and John A. McQuaid.

Election of Officers.—Montgomery Street Real Estate Co—Dec. 30th. President, John D. Fry; Vice-President, L. L. Treadwell; Actuary, A. Harpending; Legal Adviser, S. Heydenfeldt; Secretary, H. G. Walton; Treasurer, Bank of California.

De Soto G. & S. M. Co.—Jan. 5th. Trustees: S. Heydeufeldt, Wm. Willis, D. T. Bagley, John M. Burnett, I. Livingston, Adam Shane and T. H. Holt.

Hidden Treasure M. Co.—White Pine. Jan. 6th. President, Hill Beachey; Vice-President, F. G. Smith; Treasurer, John Sime; Secretary, Joseph L. King.

Adriatic G. & S. M. Co.—Jan. 6th. Trustees: Chas. Hirschfeld, J. L. Schroeder, James Bole, Simon Mayer and Camile Martin. President, Simon Mayer; Secretary, Panl Neumann.

San Francisco Stock and Exchange Board.—Jan. 11th. President, J. E. B. Cavallier; Vice-President, Geo. W. Smiley; Secretary, Franklin Lawton; Treasurer, Henry Schmiedell.

California Trust Co.—San Francisco, Jan. 11th. Trustees, Henry H. Haight, John Curry, Wm. H. Sharp, Jacob C. Johnson, Samuel Crim, Donald McLennon, Chas. W. Hathaway, John H. Baird, Henry Barroilhet, Moses Rosenbaum, John O. Eldridge, Chas. F. MacDermott, Henry J. Booth, Cbas. J. Deering, Walter B. Cummings, Chas. M. Plum, Henry L. Davis, Solomon Heydenfeldt, F. S. Wensiuger, Wm. Blackwood and Henry C. Lee.

California Dry Dock Co.—San Francisco. Jan. 11th. Trustees: Lloyd Tevis, Oliver Eldridge, Charles E. McLane, S. F. Butterwortb, I. Friedlander. President, Lloyd Tevis; Vice-President, S. F. Butterworth; Treasnrer, W. C. Ralston; Superintendent, James Pollock; Secretary, B. B. Miner. It was voted to increase the capital stock to $1,500,000. The Company are to build a powerful new tug for their business at the Dock.

Howard and Folsom St. Homestead. San Francisco, Jan. 11th. Trnstees: A. J. Moulder, Dr. W. F. Hale, E. B. Clement, J. W. Shaw, and J. C. Duncan.

Mechanios' Real Estate Association. San Francisco, Jan. 11th. President, Wm. Irving; Vice President, R. A. Rosco; Secretary, A. J. McClellan; Treasurer, A. J. Dunlevy.

Sierra Nevada M. Co.—Jan. 11th.—Trustees: L. F. Loveland, Wm. H. Sharp, A. Hemme, M. J. McDonald, and G. W. Beaver; Prosident, J. M. McDonald; Secretary, John Ferrie.

Gold Hill Q. M. Co. Jan. 11th.—Trustees, O. Gori, P. G. Veuard, H. W. Fortune, M. J. McDonald, and A. Hemme; President, O. Gori; Secretary, R. Wegener; Superintendeut, H. Huget.

Woodward's Gardens. — Everybody, when they want a few hours' recreation, should visit this popular place of resort. New additions are being constantly made to the already large list of novelties.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

For the Week Ending December 22d.

85,116.—Improvement in Feed Water-Heaters for Steam Generators.—D. F. McKim, of Austin, Nev:

I claim the heads *f*, constructed witb detachable covers, arranged upon the outside of the boiler, and with relatiou to the side and hottom pipes *e*, as herein shown and described.

85,144.—Improvement in Carriage Springs Auson C. Stowe, of Sau José, Cal.:

I claim tbe combination with tho supporting device consisting of bars H, links I, arms G, shafts E, and springs F, of the equalizing device consisting of arms K, rods L, and lever M, the whole being constructed and arranged substantially as here in described.

The object of tbis invention is to provide an improved carriage spring which, while being perfectly easy, shall overcome tbe great difficulty experienced when the load is placed mostly on one side; of the spring on that side having to sustain the whole weight and consequently sagging.

From near the ends of the axle bed and front cross-har, four standards arise, and each pair supports a shaft which extends across tbe widtb of tbe carriage. At tbe ends of these shafts are four coiled springs, whicb are attached to the reacbers and are coiled like a clock spring, the inner end being fastened to tbe ends of the shafts.

An arm or crank is firmly attached to each end of the shafts near the springs and support the four corners of the wagon bed or frame by means of links depending from these cranks. A cross-bar connects the central portion of the two reaches, and an arm is pivoted to its center. Two cranks or arms, one in tbe middle of each of the first described shafts are connected with the opposite ends of the central arm by connecting rods, so that the springs all act together, whether the load be placed on one portion of the carriage or another.

85,153.—Improved Machine for Crushing Rock.—Eskridge J. Wilson, of Fair Play, Cal. (Antedated Dec. 12th, 1868):

1. I claim one or more rows of stamps arranged in inclined positious, and in upper and lower guides, and acted upon hy springs in combination with an annular battery or batteries, formed with inclined step surfaces, and furnished witb a screw or screws, substantially as described.

2. In combination with circularly moving stampers working upon annular stepped surfaces. I also claim providing for feeding the rock from the center of the machine outwardly, substantially as described.

3. The arrangement of the driving mechanism, circularly-moving frame cylinder, stationary annular grooved bed witb inclined steps at tbe base of the groove or grooves, and the statiouary table E, of stationary frame A, A, substantially as and for the purpose described.

For the Week Ending December 29th.

[We shall publish, next week, the claims with notices annexed, of the following list:]

85,268.—Improvement in Breech-loading Firearms.—Salmon Belden and John F. Crabtree, of Visalia, Cal.

85,269.—Improvement in Expansion Wagon Wheels.—Salmon Belden, of Visalia, and Johnson P. Ford, of Santa Clara, Cal. (Antedated Dec. 24th, 1868.)

85,279.—Improvement in Derricks.—Angus Campbell, of Downieville, Cal.

85,371.—Improved Quicksilver Furnace and Condenser.—Thos. W. Dresser, of San Francisco, Cal.

85,398.—Cover for Pots, Kettles, etc.—Geo. Reuben, of San Francisco, Cal.

85,402.—Improved Shackle and Supporter.—Wm. Riley, of Salem, Oregon, assignor to H. Carpenter, of same place

85,409.—Improvement in Railroad Tickets and Punch for Cutting Coupons Therefrom.—Henry M. Stow, of San Francisco, Cal.

85,474.—Improvement in Farm Gates.—Albert J. Potter, of Omaha, Nebraska.

RE-ISSUES.

3,244.—Improvement in Gang Plows.—Robert Baxter, of French Camp, Cal. Patented Aug. 6th, 1867.

New Inventions.

Preserving Fresh Meat for Exportation.—The Argentine Republic has offered a premium of eight thousand dollars in gold to the inventor or introducer of the best system of preserving fresh meats in a manner adapted to their export on a large scale. This offer will remain open until May 2d, of this year. The proposals will he received by the Minister of Foreign Affairs at Buenos Ayres.

Machine for Scouring, Blacking and Finishing Leather.—The *Oregonian*, of December 26th, says:

We bave been shown a patent issued recently to F. W. Rust, A. E. Rogers and A. C. Gibbs, for scouring, blacking and finishing leatber, after it has been tanned. The machinery is constructed upon the top or over an ordinary table used by tanners, and may he set up in any shape, according to the size and construction of the building. A movable table is placed upon an ordinary tanuer's table, sufficiently large to receive a hide after it has been tanned. This table moves upon castors or movable balls set in the table legs. Thus the hide is moved about under the machinery, scoured, set, blocked and finished off in one-fifth of the time it takes to do the work hy hand, and it is claimed that much better leather is thus made than in the ordinary way. The machinery is very ingeniously constructed, but not very complicated or expensive. If it works half as well as it is claimed it will, the price of leatber will be greatly reduced; in fact, no tanner can afford to carry on business without it. We understand that the machines are to he made in this city, under the supervision of Mr. Rust, the inventor, and will be kept for sale.

Anti-Friction Bearing for Perpendicular Shafts. — Tbis hearing, patented through the agency of tbis office, is—says the Nevada *Transcript*—a new invention, and Messrs. Barnett, Purinton and Seibert are the patentees. It consists of a chamber or step, a hollow hemisphere, a die and a steel plate. Upon the face of tbis plate is a guide having three steel balls, each 1⅛ inches in diameter, and upon tbese balls a smooth plate is placed. Tbrougb the center of these plates tbe step of the shaft passes, and its weight rests upon the three balls. These and the plates upon whicb they move are made of bighly tempered steel; and tbe only bearings is npon the balls, the socket and die being intended to always make the bearing equal. The shaft makes two revolutions to one of the balls, and there appears to be no friction. The bearing is supplied witb a screw at the bottom so that the shaft may be raised witb ease. Tbe macbinery is very simple, and is pronounced a good thing hy all who bave examined it. The bearing we examined will be placed under the sbaft of the Nevada Flouring Mill on the 1st prox., and thoroughly tested.

Academy of Sciences.—At the Annnal Meeting of tbe California Academy of Sciences, held on Monday, January 7tb, the President, Dr. James Blake, who, witb others, was re-elected for the ensuing year, gave a brief review of the doings of the Academy for 1868, in which he referred to the loss of Professor Wbitney, tbe condition of the collections and finances of the Academy, the late earthquake, etc. During the past year, five sheets of transactions have been published, completing Vol. III and tbe first sheets of Vol. IV; there was also published, separately, Ritchofen's work on Igneous Rocks, and Lesquerenx's Lichens of tbe Pacific Coast. Fifty-uine new resident members were elected, and the debt has been mucb reduced.

The Hale & Norcross Miners who were imprisoned underground during Christmas time, for reasons probably best known to the stock dealers, bave been liberated, and the Virginia papers pronounce the business a farce. A small seam of clay had been struck, and it was expected, from previous experiences, that a rich deposit of ore would be revealed behind it. Uneasy holidays for the parties concerned, a harren vein beyond the clay, aud a loss of confidence by the public in the management of stock matters, are the results developed so far as heard from.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, January 16, 1869.

STOCK REVIEW FOR 1868.

The history of the several mines on the Comstock lode for the past year makes a decidedly unfavorable exhibit as compared with 1867, both as regards product, dividends and assessments; the falling off in the gross earnings for the last year having been vastly greater than was generally supposed. That this untoward result should give rise to much inquiry as to the cause thereof, as well as awaken some anxiety on the part of stockholders, is natural enough, though not by any means an event wholly unexpected on the part of experienced miners; nor should it be considered remarkable when occurring in the deeper exploitations of a vein of such magnitude. Having in our Annual Mining Review expressed the opinion that these results do not greatly militate against the probable permanence of these mines, much less fix upon them the certainty of a largely diminished future production, we shall not here repeat the facts upon which that opinion is based; suffice it to say they appear to rest on authentic data, being open to criticism and refutation if fallacious or ill-founded. It may further be observed in this connection, that the prices of the stocks representing these mining properties continue to be pretty well sustained, indicating a confidence in their continued capacity for production on the part of some, who, however much they may be mistaken, must be presumed to have examined this matter carefully and according to the best information extant upon the subject. What may certainly be supposed to contribute strongly towards keeping up this feeling of confidence is the fact that measures are about being inaugurated looking to a very great cheapening in the reduction of the ores from those mines; an object which, if early effected, would enhance their value at least twenty per cent. We allude to the project for constructing a railroad, the present winter, from Virginia City to Carson, with a branch extending to the Carson river at Empire City. The advantages to inure from the building of this road are so obvious that the prospect of its certain completion at an early day must necessarily tend to work a decided appreciation of these stocks.

Alpha, during the year 1868, reached its highest point in the month of April, when the stock sold at $120 per share, and the lowest in November, selling at $25. The assessments levied during the year amounted to $90,000—$30,000 in June and $60,000 in December. In 1867 the assessments amounted to $12,000, and in 1866 to $96 000. Work is now being vigorously prosecuted below the 940 level.

Belcher was not very active during the year under review. The stock advanced to $430 in April, being the highest for the year, and in March sold at $100, being the lowest. Four assessments were levied—in March, July, October and December—amounting to $101,000. Assessments to the sum of $71,880 were levied in 1867, and in 1866, $143,520.

Bullion was also one of the inactive stocks on the market in 1868. The lowest price obtained was in September—$8—and the highest in April—$160. Four assessments were levied—in March, May, August and December—aggregating $100,000. The stockholders of this company were taxed to the amount of $137,500 in 1867 in the shape of assessments, and in 1866, $175,000.

Crown Point was largely dealt in during the past twelve months, rising to $2,450 per foot, or $122 50 per share, being the highest price for that period, and falling to $38 per share in September—the lowest. The bullion receipts were largest in the month of April, aggregating $169,074, and smallest in December, amounting to $35,700. The bullion yield of this claim in 1868 amounted to $1,086,230, in 1867 $920,718, and in 1866, $1,312,471. Five dividends were disbursed—in May, June, July, August and September—footing up $360,000, and one assessment, amounting to $90,000, levied in the month of December. In 1867 the dividends aggregated $264,000, equal to $110 per share, and in 1866 $231,000, equal to $97 50 per share. An assessment of $60,000 was levied in 1867, and none in 1866. The known ore deposits in this mine were nearly exhausted at the close of the year. At latest dates the shaft had been carried to a depth of 1,100 feet. The drifts in the lowest levels have been greatly extended without discovering any new bodies of ore.

Confidence did not sell to a great extent during the period under review, obtaining the highest price in April, ($120) and the lowest in November, ($26). The bullion receipts are from June to December inclusive, showing a yield of $110,668. In 1867 the bullion amounted to $142,050, and in 1866, $401,934. One assessment was levied in March, amounting to $15,000; in 1867, $70,200 was asked of the stockholders, and in 1866, $33 000.

Chollar-Potosi was quite prominent in the stock arena during the year 1868, reaching $350, the highest price, in April, and selling at $120, the lowest, in November. The aggregate bullion yield in 1868 was $385,076, the largest product being in December and the smallest in February. Bullion in 1867, $2,668 885, and in 1866, $848,751. No dividends were disbursed in 1868; but in 1867 $150 per share, aggregating $420,000, was paid. One assessment of $140,000 was levied in the month of February.

Daney was generally, through the year, quiet, selling as high as $37 in March and as low as $3 in September and December. Three assessments were asked of the stockholders during the year 1868—in February, April and July—aggregating $56,000. In 1867, $44,000 was obtained in the same manner, and in 1866, $26,000. The developments have not been favorable during the period under review.

Exchequer did not occupy a very prominent place in the Stock Board, rising to $95 in April and falling to $10 ₱ share in September. One assessment was levied in January, 1868, amounting to $24,000. In 1867, $16,000 was obtained from the stockholders, and in 1866 $32,000.

Empire did not participate largely in any movement during the year 1868, reaching the highest price in April—$225, and the lowest in November—$90 ₱ share. The bullion returns for the year under review foot up $213,771; in 1867, $278,607; in 1866, $422,291. No dividends in 1868, but in 1867, $49,200—equal to $41 ₱ share—was paid out to stockholders, and in 1866, $32,400, or $27 ₱ share. No assessments were levied during the past three years.

Gould & Curry was moderately active throughout 1868, commanding the highest price in February ($212 50) and the lowest in November ($36). The bullion taken from this mine during the past year has been very small, extending from July to November, inclusive, and aggregating $29,557. In 1867 the receipts amounted to $614,621, and in 1866, $1,624,781. No dividends have been disbursed since 1866, and in that year the sum so paid out amounted to $252,000, equal to $52 50 ₱ share. One assessment, aggregating $72,000, was asked of the stockholders in December last, and one in September, 1867, amounting to $120,000. Work has been steadily prosecuted in sinking the Bonner shaft, but latterly, on account of the dangerous condition of the ground, work has been suspended in the lowest depth. It is hoped that some good results will follow the persevering efforts of this company during the present year.

Gold Hill Quartz ruled at $150 @ 48—highest in April and lowest in December. Bullion yield in 1868, $103,686, and in 1867, $106,400. One assessment, in March last, amounting to $10,000, was asked of the stockholders; dividends were paid in June and July, aggregating $7,500, and in 1867, $33,750 were disbursed in this manner.

Hale & Norcross was one of the most active stocks in the market, and in February, owing to the great strife for a controlling interest in the Board of Directors, sold at $7,160 ₱ foot, and even higher sums are reported to have been paid. It ruled lowest in November, realizing $46 ₱ share. The bullion product for 1868 aggregates $362,400; in 1867 it amounted to $1,097,297, and in 1866, $1,186,543. No dividends were disbursed in 1868; but in 1867, $440,000 was paid out to the stockholders in this manner, and in 1866, $350,000. Assessments, amounting to $200,000, were exacted from the stockholders in 1868, against one such demand in 1867, aggregating $60,000. Satisfactory results, as yet, have not been obtained in their lowest levels; however, work continues to be vigorously prosecuted.

Imperial exhibited considerable activity in 1868, selling within a range of $298 @ 86—highest in April and lowest in November. In 1868 the bullion product amounted to $684,040; in 1867, $1,406,496; in 1866, $910,387. One dividend, amounting to $24,000, was paid in June, 1868. In 1867, $380,000 was disbursed in this manner, and in 1866, $176,000. One assessment—$100,000—was levied in December, 1868. The developments in their deep workings through the Imperial-Empire shaft have not proved satisfactory, but as with the rest, the hope remains, and work is consequently unremittingly continued.

Kentuck has been one of the most successful claims, and has stood high during the entire year. The highest price obtained for this stock was in April, $500 ₱ share, and the lowest in November, $175. The bullion yield for the year foots up $1,259,767, against $1,140,742 in 1867, and $571,507 in 1866. This was the only company that paid a dividend every month during the year 1868, giving to its shareholders the aggregate sum of $480,000, against $505,000 in 1867. This narrow claim seems to be located in the very heart of the metalliferous body upon which this, the Crown Point and Yellow Jacket companies are working.

Ophir, upon the whole, has not been a very active stock during the twelve months under review, selling within a range of $23@14. Assessments to the amount of $167,000 were levied in 1868, against $184,800 in 1867, and $184,800 in 1866. From $417,472, the bullion yield in 1866, the receipts fell off to $4 108 in 1867, and a little over $3,000 in 1868.

Overman sold quite largely at $246@38, and as has generally been the case with the list of stocks in the market, obtained the highest rate in April, and the lowest in November. This company shows a bullion yield of $352,590 in 1868, against $192,318 in 1867, and $27,953 in 1866. The assessments for the past three years were as follows: three in 1868, $176,000; one in 1867, $32,000; six in 1866, $208,000.

Savage has been one of the leading stocks, and the sales have been unprecedentedly large, selling as high as $260 in February, and as low as $56 ₱ share in November. The bullion yield for 1868 aggregates $2,534,868, against $3,787,100 in 1867, and $1,814,879 in 1866. This company disbursed dividends in every month of 1868 except November, aggregating $1,184,000, against $1,400,000 in 1867, and $320,000 in 1866. The facts concerning the developments in the lower levels of this claim are kept very quiet; but they have undoubtedly not been any too satisfactory. The ore obtained from the locality known as the Potosi chimney, has been very large, exceeding all expectations.

Sierra Nevada ruled at $40 @ 10 during the year 1868. From September to the close of the year the bullion receipts aggregate $22,935. Assessments amounting to the sum of $90,000 were levied in 1868, against $36,000 in 1867, and $55,500 in 1866.

Yellow Jacket became quite active toward the close of the year, and has withal been one of the most fluctuating on the list, obtaining $666 ₱ foot in January, and $1,765 in November. We have estimated the bullion yield for the year 1868 at $800,000, having been unable from time to time to obtain any data whatever. The yield in 1867 amounted to $1,729,277, and in 1866, $2,297,133. A dividend of $360,000 was disbursed in November, 1868; in 1867, four were paid, aggregating $300,000, and in 1866 six were disbursed amounting to $390,000. An assessment of $150,000 was required in January, 1868; in 1867 $240,000 was needed for the same purpose, and in 1866, $180,000. It is reported that this company has been successful in reaching a body of good paying ore; at all events, the payment of dividends indicates a greatly increased yield of the precious metal.

Amador (Cal.) has been one of the firmest stocks on the market, and has been mostly sought by those who desire to obtain a good interest on their money, and not for speculative purposes. It sold in 1868 within a range of $325 @ 195—highest in March and lowest in October. Bullion product of 1868, $548,783. Dividends have been paid in every month of the year, aggregating $286,000.

Annexed will be found a condensed tabular statement of the foregoing extended statistics regarding the claims on the Comstock Lode, together with the aggregate figures concerning the same for the years 1867 and 1868:

Company.	Bullion.	Assessment.	Dividend.
Alpha		$90,000	
Belcher		101,000	
Bullion		100,000	
Crown Point	$1,086,230	90,000	$360,000
Confidence	110,668	15,600	
Chollar-Potosi	885,076	140,000	
Daney		56,000	
Exchequer		24,000	
Empire	213,771		
Gould & Curry	29,557	72,000	
Gold Hill Quartz	102,686	10,000	7,500
Hale & Norcross	362,400	200,000	
Imperial	684,040	100,000	24,000
Justice & Independent		52,500	
Kentuck	1,259,767		480,000
Lady Bryan	20,000	150,000	
Ophir		167,000	
Overman	352,590	176,000	
Segregated Belcher	4,371	38,400	
Savage	2,534,868		1,184,000
Sierra Nevada	22,805	90,000	
Yellow Jacket	*800,000	150,000	360,000
In 1868	$8,499,769	$1,825,500	$2,415,500
In 1867	13,628,602	1,296,250	3,251,950
In 1866	11,732,100	1,194,820	1,734,400

* Estimated.

It is estimated that seven-tenths of all adult ailments proceed from a diseased and torbid liver. The biliary secretions of the liver overflowing into the stomach, poison the entire system, and exhibit the above symptoms. After a long research, we are able to present the most remarkable cure for these horrid nightmare of diseases the world has ever produced. Within one year over six hundred and forty thousand persons have taken PLANTATION BITTERS, and not an instance of complaint has come to our knowledge. It is the most effectual tonic and agreeable stimulant, suited to all conditions of life. Inquire of your druggist in regard to it.

HAVE you tried Muller's Brazilian Pebble Spectables, undoubtedly the best in use? 205 Montgomery street.

Returned.—Dr. J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

PAIN KILLER.

No article ever attained to such unbounded popularity.—*Salem Observer.*

An article of great merit and virtue.—*Cinn. Nonpareil.*

We can hear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch.*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Texas. Organ.*

It has real merit; as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*

It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.* 26v17-1m

Industrial Publisher,

No. 406 Walnut Street, Philadelphia.

HAS RECENTLY PUBLISHED

A Practical Guide for the Perfumer; Being a New Treatise on Perfumery the most favorable to the Beauty without being injurious to the Health, comprising a description of the substances used in Perfumery, the Formulæ of more than one thousand Preparations, such as Cosmetics Perfumed Oils, Tooth Powders, Waters, Extracts, Tinctures, Infusions, Spirits, Vinaigres, Essential Oils, Pastels, Creams, Soaps, and many new Hygienic Products not hitherto described. Edited from Notes and Documents of Messrs. Debay, Lunel, etc., with additions by Professor H. Dussauce, Chemist. 12mo. $3 00

Cabinet Maker's Album of Furniture; Comprising a Collection of Designs for the Newest and Most Elegant Styles of Furniture. Illustrated by 48 large and beautifully engraved plates. In one volume, oblong. 5 00

The plates of this beautiful volume comprise designs for bedsteads in great variety; chests of drawers; wardrobes; dressing bureaus; tables for the chamber; work-tables; extension dining tables; card and chess tables; parlor tables, Louis XV. and other styles; office tables; chiffoniers; ladies' and other secretaries of different forms and styles; toilet tables and glasses; desks; book-cases; sideboards, etc., etc.

Gothic Album for Cabinet Makers: Comprising a Collection of Designs for Gothic Furniture. Illustrated by 23 large and beautifully engraved plates. Oblong. $3 00

The plates in this volume comprise designs for sofas, arm and other chairs, stools, taborets, prie-dieu, tables, chests of drawers, wardrobes, chimney-pieces, side-boards, pier tables, etageres, desks, book-cases, etc.

A Practical Guide for Puddling Iron and Steel.—By Ed. Urbin, Eng. of Arts and Manuf. A Prize Essay read before the Association of Engs. Graduates of the School of Mines, of Liege, Belgium, 1865-6. To which is added a Comparison of the Resisting Properties of Iron and Steel, by A. Brull. From the French, by A. A. Fesquet, Chemist and Engineer. 8vo., cloth. $1 00

☞ The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo. is just ready, and will be sent free of postage to any one who will favor me with his address. 20v16tf

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Jan. 2d: The roads between Diamond Hill and Woodferd's are in snch a condition as to prevent the transportation of Morning Star ore down and lumher back. The consequence is, the Pioneer mill lies idle for want of ore, and the progress of the flume for the M. C. mill is delayed.

AMADOR COUNTY.

Jackson *Ledger*, Jau. 9th: The mining property heretofore known as the Coney & Bigelow mill and mine, has passed into the hands of a stock company, and incorporated, with a capital of $300,000, divided into shares of $100 eacb. We learn that the company will immediately commence sinking a new sbaft south of the present one, whicb will afford them greater facilities for working the mine.

FRESNO COUNTY.

Mariposa *Mail*, Jan. 8th: Hughes & Keyes, of Stockton, reccived, one day last week, at their warehouse, 10,000 lbs. of copper matt from the Buchanan mine, Fresno County.

MARIPOSA COUNTY.

Gazette, Jan. 8th: The work at the celebrated Hite's Cove mine have heen suspended temporarily, hut, we are informed, will be resumed again in a short period.

NEVADA COUNTY.

Transcript, Jan. 5th: The miners throughout the county now have an abundance of water for mining purposes, and the hydraulic claims are all being worked. The present supply of water will he sufficient for two or three weeks.

A correspondent writing from Relief Hill, gives the following items: Our mines are paying. The claims formerly owned by the North Star Co. are now being worked by the Water Co. Their ground looks well. The What Cheer Co. cleaned up lately, and I was told that their claims pay well. The Waukesha, or Welsh Co., have extended their main tunnel north across the channel 100 feet, and west 150 feet, to the Eagle Co's lines. The channel proves to be both extensive and rich.

The Eagle Co. are extending their tunnel, and will get to washing sometime during the summer.

The Union Co's last clean up was $4,000, of which the company cleared half. They are running a drifting tunnel on a portion of their ground. It prospects well.

Jan. 7th: The Boston Co. at Woolsey's Flat, are negotiating for the sale of their claims to a Chinese Co. at $16,000.

There is a prospect that some of the mines in the vicinity of Orleans Flat will pay well again. Wm. Obermau is making arrangements to open an extensive set of diggings at this place.

In the last two or three years a considerable amount of capital has been invested by Chinese companies in the mines of this county. The St. Lawreuce claim at Moore's Flat was recently sold to the Wo Sing Co. for $7,000, and the Piute claim at the same place was sold to the Wah Yea Co. for $2,000. Both companies are at work and will doubtless do well.

Jan. 8th: J. B. Brown & Co. have located 1,500 feet on Sailor Ravine, below Bowen's reservoir, for mining and fluming purposes.

The new hoisting works of the Pittsburg Mining Co., started up for permanent work yesterday.

Jan. 9th: Atwater & Knotwell are running a prospect tunnel into the Blue Coat diggings at Woolsey's Flat. This ground is on the same range with the I. X. L. Co., and extends to Bloody Run. Robert H. Barton & Co. have located 300 feet on a lead near the junction of Wood's Ravine and Deer Creek, adjoining tbe claims of Leathe & Co.

Atwater & Knotwell have a claim at Moore's Flat 800 feet in width, and more than a mile long. Last fall they made a run which cost them not less than $3,000, and they took out $11,000. A part of the dirt had to be raised by hand derricks.

The *Gazette* says: The Americau Co., at Manzanita Hill, cleaned up only a portion of their sluice last week, of eight days' run, and realized $14,000. Miners up and down the ridge are husy as bees, and doing well. The Buckeye Mining Co. purchased of Stephen Spencer, recently, a portion of Sweetland Creek, paying for the same $20,000.

Grass Valley *National*, Jan. 4th: The proprietors of the Grass Valley ledge situated on Wolf Creek, near Hill's ranch, propose to erect boisting works and put in a 6-inch pump immediately. The compauy own 1,700 feet, and are down ahout 50 ft. on the ledge. The rock looks well and shows gold in abundance.

Grass Valley *Union*, Jan. 8th: The Shanghai mine, on Massachnsetts Hill, continues to give out rock which pays from $70 to $90 per ton. The Grant mine, situated near Forest Springs, coutinues to pay well, the rock crnshing, independently of snlphnrets, in the neighhorhood of $50 per ton. The Howard Hill mine is paying at the rate of $25 per ton, with ground easily and cheaply worked. The Higgins & Larimer ledge is showing good rock, and the mill to crush it is rapidly approaching completion. The Seven-Thirty mine and the Bowery, on the beadwaters of Sqnirrel Creek, are both proving themselves very rich. We anticipate a lively and successful season in mining at Grass Valley duriug next summer.

Transcript, Jan. 10th: Frank Bixler & Co. located 1,500 feet on the southern extension of the Grass Valley Co's quartz ledge, and have called themselves the Yonng Pine Co.

Grass Valley *Union*, Jan. 10th: In the Roannaise mine, west of the Eureka Co's ground, some splendid rock has been taken out of late. The company owning the Roannaise, we hear are making arrangements for its early working with every prospect of great success.

Grass Valley *National*, Jan. 11th: The Garden City ledge, on Mill street, thns far sbows favorable prospects. The ledge is well defined, is from a foot to 18 inches in width, aud the rock is rich in free gold and snlphurets. Steam-power machinery for hoisting and pumping is to be erected this week.

Frank Morse, on the Higgins & Larrimer ledge has a splendid show in the hottom of the shaft he is sinking. The ledge there is abont three feet wide, and the rock will pay as high as $75 to the ton. The stormy weather will delay the starting up of the mill for several days.

The Howard Hill Co. have splendid rock at their 200-foot level. Some specimens brought into Peter Johnson's, yesterday, shows exceedingly rich in free gold, and heavy sulpburets. They have ahout 150 tons of splendid looking qnartz on top of the ground, but the mill is out of wood, and not able just now to crnsb.

A miners' meeting was held on last Saturday night in this place, to take some action in relation to parties claiming mineral land as agricultural. Resolutions were passed to raise immediately a subscription with which to assist the miners of Green Valley, to emyloy counsel to argue the case now pending in the Supreme Court of California; and also to aid and assist miners throughout the State to maintain their rights against all persons seeking to hold mineral lands as agricultural.

EXCELSIOR.—*Transcript*, Jan. 7th: A correspondent writing from Meadow Lake, says the snow on the 28th of December was from 18 inches to two feet deep, and it commenced storming at that time, continuing without intermission until the morning of the 3d inst. The snow was then six feet deep on a level, and in some places was piled np over 12 feet.

Jan. 8th: The Mohawk & Moutreal Mining Co., Meadow Lake, are engaged in running a tunnel from the level of the mill, which will tap the ledge 460 feet below the surface. The company also intend to put up concentrators in the mill, and build furnaces for working the ore by the chlorination process.

PLACER COUNTY.

Auburn *Herald*, Jan. 9th, From the Forest Hill Divide, we learn tbat the snow has gone off with a rain, and that the ditches are all full, tbe miners are abundantly supplied witb water, and good times generally about to commence in that section of the county.

We were shown some remarkable rich rock and specimens which was taken from the Green Emigrant claim a few days ago,

PLUMAS COUNTY.

Quincy *National*, Jan. 2d: The Taylorville correspondent writes: Work is being pnshed vigorously ou at the Enterprise. I understand that Mr. Chapman has started his blast furnace in Coppertown, Genesee, again, and is hard at work smelting copper.

SIERRA COUNTY.

Downieville *Messenger*, Jan. 2d: The Gibsonville correspondent writes: Mr. Redding, of Forest City, has lately purchased an interest in the Chalcedony claims. The Youug America and Miller & Co. have fitted up their claims for hydraulicing as soon as water comes. Mr. Sqnire, of the Second Ravine claims, has added a water-power derrick to them. The Union is running a dry weather complement of hands, but need water to clear their yard. They wasb enough each week to pay expenses. The New Glasgow, after many discouragements, report progress, and hopes of better success. The Nip and Tuck are finely fitted np, and have out a large pile of dirt. They are working about 25 hands, and ueed water for cleaning their yard. These are new claims, and have yet to make their first washing of any extent. They are reported as prospecting finely; aud I saw a prospect yesterday, of not over a dollar, in several pieces, picked ont of a lump of dirt not larger thau one's fist. The Nevada have their yard full, and have had to discharge their hands until the water comes.

The Swift Sure claims, that have heen in a sickly state for sometime past, are reported as convalescent; more gravel and a fine prospect having been struek in them. The Redding, Phœnix, and North American, at Hepsidam, are in an active state, with fine gravel. The Talipat claims, hereabouts, show no sign of yielding ore. Work has been suspended, and doubts are entertained about reaching a chaunel within a reasonable time, if at all.

The new qnartz mill at the Independence mine was started on Monday of this week.

La Porte *Union*, Jan. 2d: The Port Wine correspondent writes: The mining companies managed to wash a little of the dirt in their dump sheds during the rain storms. Unfortunately, when the storm abated, there was a severe freeze which dried up the streams very suddenly; we are in hopes, however, of having another storm which will give all the companies water enough to finish washing their dirt. The Union Co. is again idle, owing to a break in the water wheel.

YUBA COUNTY.

Marysville *Appeal*, Jan. 10th: The Pennsylvania mine and machinery have been undergoing repairs the past week. The boilers have been reconstructed, the track of the incline relaid, and the incline retimbered. The superintendent is now ready to commence taking out rock and go to crushing. The prospects of the mine are said to he flattering.

COLORADO.

Georgetown *Miner*, Dec. 17th: John R. Beverly started his new 12-stamp mill in Nevada yesterday....Huependen, Wolters & Co. have taken out and shipped, since Nov. 23d, $4,454.65 in silver, coin value.... Schrimer & Bruckner took off on Saturday last, 164 lbs. troy of silver bullfou, coin valne, $2,646.80. The amount of ore reduced was seven tons from different lodes, the result being $379.54 coin per ton.... Prof. Stewart has taken out during the mouth of Novemher, 2,315 ozs. of silver bullion, coin valne, $2,611.58.

Central City *Herald*, Dec. 16th: The Douglass 20-stamp mill which has been running on the Union Co's claims, on the Bates lode, has been shut down....Ed. Moores has leased Mr. Tierney's claims on the Hope lode, and is running the discovery shaft on the same, night and day. At a depth of 55 ft. the walls are very solid, and the ore veiu is widening out with every indication of very soon forming into a good sized vein of pay material. The ore will be crushed in Nesmith's new stamp mill. ....Mr. Ball, of New York City, is erecting at Black Hawk, the necessary apparatus for a new process—an invention of his own—in the Hartley mill building, just above the Manhattan Co's mill. It consists of a crusher, desulphurizer, and amalgamator.

The new mill of the Smith & Parmelee G. M. Co. is being rapidly completed.... Robert Teats is making 600 ozs. of silver per day from unselected ore. His mine is looking better than ever before....Marshall & Terry are fitting up the Chicago Co's 20-stamp mill. on North Clear Ceeek. It will be run on custom ore....Miley & Abbe are preparing to erect a 30-stamp water mill on North Clear Creek, below the mouth of Missouri Gulch....Woodbnry & Co. are running their 23-stamp mill on ore from the Barronghs lode, Nevada district, and on ore from the Illinois lode, Qnartz Hill.... Prospecting in Slaughter House Gulch is being vigorously prosecuted. While at Black Hawk last evening we were shown a very nice appearing quality of sulphurets, from a recent discovery in that vicinity.... We saw four silver bricks at the First National Bank to-day, weighing, together, 1,316½ ozs., from Robert Teats, of the California Reduction Works.

The Georgetown correspondent writes: The drift on the Mendota lode is now about 70 ft. in lengtb, and has exposed a fine body of ore, yielding not far from $120.

The Snow Drift is prodncing some very rich ore. Prof. Bowman struck a big thing some 500 ft. east of this lode from which specimens were obtained, assaying as high as $5,000 per ton. It has since been proved to be on the Snow Drift.

Central City *Register*, Dec. 12th: Samuel Lathrop is developing a splendid silver vein in Silver Gulch.

The old Pat Casy mill in Chase Gulch, is as husy crushing ore, as it used to be six years ago.

J. L. Schellinger is raising some fine and very rich ore from the De Cordova lode, and there appears to be plenty of it. The shaft is 75 ft. deep, and in the bottom the pay veiu is fully two ft. in width. The ore is mixed iron and copper pyrites, much of the latter heing the Peacock ore, and exceedingly rich.

Mr. Teats informs us that his mine on the Gilpin County lode has been opening ont better than ever during the past few days. In one place he has fully three ft. of rich pay ore. He has also been taking some exceedingly rich ore from the Coaley lode—sulphurets, thickly studded with native silver. His mill is turning out its regular 500 ozs. per day.

IDAHO.

Silver City *Tidal Wave*, Dec. 29th: During a recent visit to the Owybee mill we examined the pile of Golden Chariot rock on the dump. We found from 45 to 50 tons of ore, in every piece of which, so far as we broke or examined it, both gold and silver were plainly visible. We brought away a specimen which is perhaps a little better than an average sample that would create a panic should it be shown as a White Pine production. Washoe never saw such a pile of rock, and their $500 or $600 ore at White Pine sinks into insignificance in comparison. They have crushed about 100 tons in the Owyhee, which is still running on the same rich ore, and have partially cleaned up once or twice, hut have not retorted as yet.

We saw several loads of Poorman rock recently that reminded us of former times. The mine is yielding a superior quality of ore just now and the miners represent it as being abundant.

The Woodstock still turns out rich rock and plenty of it.

The Pickens & Edwards has commonced sending ore to Black's mill in Flint.

The Ida Elmore mill is making a splendid run on superior ore.

Jan. 5th: The first bricks were run in the Rising Star mill on New Year's day. They were three in number and weighed in the aggregate 160 lbs. avoirdupois.

The prospects at Willow Creek are very good for moderate surface diggings.

Owyhee *Avalanche*, Jan. 2d: Forty tons a day of the almost fabulously rich ore of the Ida Elmore mine is now being crushed at the company's mill. The mine presents a better appearance now than it has at any time since its discovery.

We were recently shown specimens from the Pick & Porter ledge, which cannot be excelled anywhere. It is exceedingly rich in sulphurets and literally speckled with pure, unalloyed gold. The streak which bears this character of ore is about six in. wide. The ledge averages over 18 in. in width and growing wider as the tunnel progresses, which is now driven in on the lode a distance of 75 ft.

Tierney & Co. are sinking a shaft on the third south extension of the Oro Fino; it is down 40 ft.; the ledge is well defined, and at that depth exhibits a width of 15 inches of exceedingly rich ore—native gold being plainly visible in a great portion of it.

The Poormau ledge is now yielding from 25 to 40 tons of ore per day, of a very rich quality. The ledge is getting wider as the work progresses npon it; and by the aid of their new and improved machinery the mine will soon he able to constantly supply the mill with ore.

Peck, Cope & Co. have sold the Potosi mine to a San Francisco company for $30,000.

The Boise *Statesman* says: We learn from Dick Griffin, Supt. of Hailey's line, that a 75-lb. nugget, containing about one-third gold, was found last week near El Dorado City, on the slope towards Shasta Creek.

MONTANA.

Helena *Post*, Dec. 18th: New diggings have been struck near the lower finme of Dr. Hunter. They were first discovered in widening a flume, and before night the ground was all taken and recorded. The prospects are from 10 to 15 cents to the pan, and great excitement prevails in regard to the discovery. The claims of the Brumley boys and Mr. Thomas are still being worked with good results.

With but little interruption the Ricker mill has been crushing rock from the I. X. L. works of the Union Whitlatch mine during the past year, and has cleared for its owners $200,000 above expenses.

In Rochester district, Hendrie and McAndrew & Wann's mills are in full opera-

tion, and are crushing day and night. The Hendrie mill is constantly employed upon the Watseka rock. The McAndrew & Wann mill on that and custom rock. Although the clean ups are not made known, enough is known to give assurance of highly satisfactory results when they are given to the public. A new mill is to be erected there in the spring under charge of Mr. Vance, representing an Illinois company. The district is in a most flourishing condition, and bids fair to be the most attractive to millmen of any in the country. In Silver Star a large amount of work is being done on almost all the lodes. The Trivitt mill has been stopped for a short time to renovate some of the machinery. The Everett mill is pounding away upon the Green Campbell rock, with every promise of success.

Yesterday the I.X.L. mill cleaned up 400 ozs. of gold from an eight days' run, amounting to about $9,000.

NEVADA.

HUMBOLDT.

Unionville *Register*, Jan. 2d: The Winnemucca correspondent writes: Buck & Kunkel have struck another very rich deposit in the Pride of the Mountain. A large specimen of the ore, weighing 70 lbs., literally spangled with native silver, is now on exhibition at the office of the Pacific Union Express Co.

REESE RIVER.

Austin *Reveille*, Dec. 26th: There are reports of the discovery of rich deposits at White Pine during the past week.

Jan. 1st: During the year 1868, there was shipped from this city 2,357 bars of bullion, valued at $2,745,948.63.

Jan. 2d: The principal mines in Silver Bend are developing immense masses of choloride ore, which in Leon & Co's El Dorado South is 50 to 100 feet deep.

White Pine *News*, Jan. 2d: The last lot of ore worked from the North Aurora mine went $384 per ton. There is a large quantity on the dumps, of second class ore, that will yield $150 per ton.

A company operating in this district has purchased the mill of the Big Smoky Co., and will move it to this place.

The Irvine ledge shows plenty of horn silver, and very little base metal.

The Governor ledge shows 12 feet of quartz and a fair quantity of milling ore.

The Mazeppa mine improves rapidly in the quality and quantity of its ore. Some of the ore is fully equal to any found in the Eberhardt.

In the California ledge some very fine chloride ore is in sight.

The ore house of the Oasis mill contains at present from 425 to 450 tons of Eberhardt ore, that will yield from $600 to $1,000 per ton.

NEW MEXICO.

Santa Fe *Gazette*, Dec. 12th: Col. Anderson who was in the city early in the week, reports the quartz mill of the New Mexico Mining Co. as constantly at work, and turning out the usual quantity of the precious metal.

The new coal mine is one of the best in the country and will prove a source of great economy in working the company's machinery.

Central City (Col.) *Register*, Dec. 2d: The mining interests in Mexico now bear a brighter aspect than ever before. The government has recently passed a law allowing bullion and coin to be shipped out of the country at 2¼ per cent. Seven American companies are at present taking out 700 to 800 ozs. per day. In the San Miguel tunnel a vein has been cut nine feet wide, which yields $6,000 to the ton, and this is their second class ore. Their first class ore yields $17,000 to the ton.

OREGON.

Portland *Oregonian*, Dec. 26th: Wm. Hitchcock and others, of Umatilla, will set up a new quartz mill in Eagle Creek next spring.

WYOMING.

Sweetwater *Mines*, Dec. 23d: The vein of the Walrussa ledge is 2½ to 3 ft. in width with good wall rock. The ore exhibits free gold in abundance.

We extract the following from an article in the Central City (Col.) *Herald:* South Pass City is very pleasantly located and the climate is fine, its altitude being about the same as Denver. Mr. Anthony visited and inspected 12 of the best developed lodes. Some of them have more than one shaft sunk, and are opened to a depth of from 35 to 80 ft. and show crevices varying from 18 in. to 2¼ ft. The ore shows free gold from the top down, and runs in common stamp mill from $7 to $100 per ton, and some has shown $800 per ton by assay. There are three stamp mills in operation, two run by water, and one run by steam. There are five gold-producing gulches, which pay $15 per day to the man. The principal gulch is Rock Creek Gulch which has oceans of water, and is known to have paying mines for miles. Some of the claims on this creek have paid $75 per day to the man.

[Owing to a press of matter this week, we have been compelled to condense our summary to a considerable extent, and leave out some important news, which we will present to our readers in our next issue.—Eds. Press.]

McLennan, Whelan & Grisar's Wool Circular.—This annual publication presents a synopsis of the wool trade of California for 1868, embracing the exports and value of the leading products for the past ten years. California furnished to this firm in 1867, 681,022 pounds, and Oregon, 577,325 pounds; in 1868, 885,900 pounds, and Oregon, 421,460 pounds. The total export in 1867 was 10,758,531 pounds, and in 1868, 15,539,417 pounds.

The spring clip of 1868 was the best ever shipped from here, and has brought our wool in favor with the Eastern manufacturers; but it appears that the quality of the wool sent to market varies very much with different seasons, for some reason or other not accounted for.

California wools, at present, class as Medium Wools, and even the choicest clips do not come up to the standard of Fine Wools as compared with some other wools.

It is thought that most of the flocks at present in this country would be much improved by the infusion of a little blood of long-wooled sheep. Local factories worked up, in 1867, 2,975,000 pounds, in 1868, 2,694,236 pounds.

Swansea (?) Furnace in Colorado.—A furnace now brought into use in Colorado, is thus described in the *Artisan's* report of the proceedings at a recent meeting of the Polytechnic Association of the American Institute: This furnace is designed for burning the sulphur from copper and iron pyrites, and is described as consisting of a hollow vertical shaft about twenty feet high, with an internal horizontal area of four feet by two. This shaft has arranged within it a number of triangular bars made of fire-clay, about four inches wide. These bars are placed about four inches apart, and constitute a series of shelves "arranged alternately in the same vertical line," the series extending nearly to the bottom of the shaft. The fuel by which these shelves and also the entire interior of the furnace is heated, is placed in a detachable fire-grate arranged in the bottom of the shaft. When by this means the furnace and the shelves have been heated to the required degree, the grate is removed, and the pyrites, which must contain at least 16 per cent. of sulphur, is poured in at the top of the shaft, a sufficient quantity of air being simultaneously admitted at the bottom of the latter to furnish oxygen for the combustion of the sulphur, this combustion evolving sufficient heat to make the process continuous. The gaseous products of combustion, which of course consist, for the most part, of sulphurous acid gas, are conveyed away by suitable means, and employed in the manufacture of oil of vitriol.

Patent Office Rule.—Commissioner Foote issued the following circular, Oct. 1st, 1868: "To Applicants and Attorneys—The practice of returning to applicants and attorneys the specifications and other papers filed by them, to enable them to amend the same or for other purposes, has been discontinued.

Specifications filed previous to the 1st day of October, 1868, will be returned *once* if called for, in order that the applicant or his attorney may make a copy, if he desires to do so.

In the case of applications for patents filed subsequent to the aforesaid 1st day of October, the applicants will be expected to retain copies of papers so filed, or to rely on the office for copies thereof, at the usual rates. Elisha Foote, Com'r.

Judgment of Men's Capacity.—Ralph Waldo Emerson says: A man passes for what he is worth. Very idle is all curiosity concerning other people's estimate of us, and all fear for remaining unknown is not less so. If a man knows that he can do anything—knows that he can do it better than any one else—he has a pledge of acknowledgement of that fact by all persons.

Our Mining Interests.

[From the Commercial Herald.]

New Mexico.

A good deal of attention has been paid the past year to gold prospecting and mining in this Territory, leading to the discovery of very extensive districts abounding in auriferous veins and a considerable extent of surface deposits. The districts in which the most encouraging discoveries have been made, and in which the greatest activity prevails, lie in the Moreno Mountains and in the Cimaron and Pino Alto country, where several thousand miners have been engaged, the most of them realizing fair, and many of them large wages. Water having been supplied more abundantly, through ditches lately constructed, mining was being carried on both by sluice and hydraulic washing, the business having before been performed mostly through the aid of the batea and rocker. A number of quartz mills and smelting works have been put up in the several districts; some of the ores requiring smelting, though the most of them are capable of reduction by mill process. A considerable amount of bullion has already been shipped from that region, which is likely soon to become the theatre of permanent and profitable mining.

Alaska.

Although this newly acquired possession is known to be rich in coal, copper and iron, we have yet to demonstrate that it contains any great wealth of the precious metals, the explorations thus far undertaken having failed to establish the fact, or even give strong confirmation of the rumors bearing affirmatively on that point. That there is a considerable extent of low grade placers along the Stickeen, and perhaps several other rivers, has been known for a number of years past, but as they have capacity to pay not above $3 or $4 per day to the hand, they are, under the circumstances, for the present valueless. Several prospecting parties, during the past Summer, made more or less extended trips along the inland rivers and streams in search of paying placer mines, but, so far as has transpired to the public, without having secured the object of their search. The rumor prevalent in this city about one year ago of very rich gold bearing ores having been found on a stream not far from the coast does appear to have been well founded, no confirmation of it having since come to hand.

COPPER.

In this branch of mining there has been an almost total suspension of labor the past year throughout all parts of this coast, the depressed state of the market, both at home and abroad, forbidding active operations. How long this discouraging state of things is likely to last, it is impossible to say, though a slightly increased demand for these ores, with a better margin for sales, is already discernable; and there is a prospect that, from this time forth, there will be a gradual revival of this important interest. The shipments from San Francisco for the year amounted to 5,042 tons; of which, 1,450 were sent to Great Britain, and 3,592 to New York.

COAL.

The various companies engaged in mining for coal at Mt. Diablo and other points on this coast, have been more than usually active the past year, taking out more than their ordinary complement of this fuel, for which they have found a ready and remunerative market. They are all in a moderately prosperous condition, with no prospect of being forced to curtail their operations at present either through a lessened demand or a failure in the capacity of their mines.

BORAX.

After an annual production of about 500 tons of this salt, the company engaged in its extraction in Lake County have, from some cause unknown to the public, suspended operations, none having been shipped to this city by them for some months past—none, in fact, having been produced at their works, but whether from failure in the supply of the raw material or from considerations of a business nature on the part of the company, we are not advised. It has always been understood that the crude article existed at Borax Lake in inexhaustible quantity, and that it could be prepared and delivered in this city at prices leaving a good margin of profits—all of which is doubtless true. But so it has happened, that after importations had ceased, in consequence of expected supplies from this source, the market is now found to be quite bare of this commodity, causing prices to advance materially, while it is said this company do not contemplate a resumption of operations within some months at least. This is certainly an anomalous and, to the public, an unfortunate state of affairs, and one which they will look forward to the solution of with some degree of curiosity.

QUICKSILVER.

As is generally well known the several Quicksilver mining companies of California have entered into an arrangement looking to a restriction of their joint production to a quantity not likely to be largely in excess of the prospective consumption of that metal. Without inquiring into the legitimacy or policy of such an arrangement, it may be observed that the stock of the principal company entering into it would seem to have since suffered a material depreciation, having been quoted four years ago in the New York market at $100, at which time the company declared and paid a handsome dividend, showing a prosperous condition of affairs whereas the stock to-day is only quoted in New York at $25, the market having for some time past been depressed and fluctuating. It is true, this may have been one of the objects aimed at from the first—a view of the matter requiring for its entire justification the not very violent presumption that this extensive combination was effected more for stock jobbing purposes than for prosecuting a legitimate mining business. In regard to this, however, we are not posted, though it is a little singular that a company which a few years ago valued its possessions at many millions of dollars, and was doing a large and profitable business, should now find itself deeply in debt, if their own statements are to be accepted as true. This is certainly an anomalous state of affairs, arguing a little sharp practice or a bad financial status on the part of the company, or else a very unprosperous condition of the Quicksilver mining interest.

Operations in Tin Mining.—Pioche and others who are interested in tin mines in the southern coast, have engaged practical tin miners—the Williams brothers and others—and have commenced actual operations, not only in mining for tin, but in making preparations for dressing. Whether all the delicate tin dressing paraphernalia of Cornwall and the Erz Mountains are to be put in operation, is a question of economy which does not appear to have been fully determined. It is presumed the ores are rich enough, as at the Banca mines, to pay without going into such detail. Smelting operations are not to be undertaken until Spring.

Since writing the above, Mr. William Williams, M. E., has brought us samples of tin ore from the mines in question, which are located in the Temescal Mountains, sixty miles nearly due east from Los Angeles, and easterly from San Bernardino town. They have sunk a shaft in a foot-hill, of forty feet depth, and another situated 268 feet towards the north of the preceding, on a rise of the hill, which is eighty-six feet in depth. The ledge has been cross-cut between the shafts four times, showing an average of about nine feet in width; trend of the ledge, N. 34°; it dips to the west at an angle of 17° from a vertical line. Mr. Williams had 2,200 pounds of ore brought up with him, and eight tons more are on the way. The estimated yield from four cross-cuts is 20 per cent., the predominant ore being brown oxide of tin (black tin). The ores thus far produced will be worked into white tin, in this city. Regarding the specimens, see "Contributions to Our Cabinet."

Acarus Sacchari.—Never use raw (unrefined) sugar. It is almost sure to contain the insect named above, which is akin to the *Acarus scabiei*, or *itch* insect. Dr. Harsall of London found it in 69 out of 72 samples of raw sugar. He did not detect it in a single specimen of refined sugar.

"Island No. 10," in the Mississippi, was turned by the Union forces in the late war, by the construction of a canal in one of the chasms left by the earthquake of 1811.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

A. B. BUTLER, California, agent and correspondent.
WM. H. MURRAY, California.
DR. L. G. YATES, California.
S. H. HERRING, California and Nevada.
T. G. ANDERSON, Nevada.

Resident Agents.

WHITE PINE DISTRICT.—Alexander Bruckman, Hamilton, Nevada.
HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
A. S. Hopkins, No. 70 J street, Sacramento.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:

Saturday Morning, Jan. 16, 1869.

Notices to Correspondents.

MORTAR.—Adhesion takes place solely between the surfaces of bodies. Anything, therefore, which increases the extent of surface materially extends the exertion of the force. Minute subdivision by increasing the extent of surface, greatly increases the effect of adhesion, hence the advantage arising from carefully slaking lime so that no lumps may remain. A cube of one inch on the side will expose a surface of six square inches: *i. e.*, there is a square inch of surface on each of its six faces. Suppose this cube to be subdivided into a number of smaller cubes, each of which is only 1-1,000th of an inch on the side; 1,000,000,000 such cubes would then be contained in the spaces formed from one cubic inch. Further, as each little cube has six sides, the surface which it will expose is 6-1,000,000th of a square inch, or 1,000,000 of them will expose six square inches; that is, as much surface as a solid cube of an inch on the side; the 1,000,000,000 cubes will consequently expose 1,000 times as large a surface, or upwards of 41.6 square feet. The force of adhesion, therefore, by such a subdivision, should be increased somewhat in this proportion.

TURBINE, Sonoma County.—See the continuation, this week, of our article on turbines, for the information you seek. Instead of thirty-eight revolutions a minute, our article should have read 1,338,—for a 16-horse-power, and sixty miners' inches of water, at 100 feet head. Such a turbine measures nine inches in diameter, and costs $100.

J. C., SONORA.—Chemical affinity can only be displayed between bodies of dissimilar constitution. No manifestation of this force will take place between two pieces of iron, or two pieces of copper, supposing each substance to be perfectly pure of its kind; but between sulphur and copper, or sulphur and iron, chemical action of the most intense energy can be produced.

CISCO.—Molybdinum is chiefly esteemed as a mineral rarity, being found generally in the state you describe, viz., possessing the appearance of plumbago, for which it is often mistaken. In that form this metal is combined with sulphur, forming the sulphide of molybdinum. The use of molybdinum is chiefly confined in the arts to the detection of phosphoric acid. It is used for this purpose in the form of molybdate of ammonia.

MINER, Cherokee, Butte County, will be informed in due time, of the methods in use for purifying quicksilver.

CLARENCE KING and his geological party, have reached Salt Lake and partly disbanded. Several of the members are to remain there for the winter. Mr. King goes on to Washington to prepare his report for publication. Next spring the survey will be continued from Salt Lake eastward.

Velocipedes.

The substitution of mechanical spokes and felloes for what Oliver Wendell Holmes has designated as the human wheel—the legs, being a wheel of two spokes, which constantly replace each other—affords such obvious advantages for speed, and even for economy of exertion on a level road, that it has not taken long for the velocipedes to establish themselves in San Francisco, in the favor of everybody who can appreciate the beauties of a mechanical idea applied to some practical purpose. American inventive talent has taken hold eagerly of the idea of the velocipede, and if something of a practically useful and successful character be not developed out of the velocipede idea, it will be owing to the fact that the mechanical principles involved are adverse thereto. Yet it is all so simple, and the conclusion reached at first glance is so self-evident, that we are assured the attention given to, and the hopes entertained of velocipedes, are not futile. At the least favorable estimate of the value of velocipedes, they may be said to have the advantages of skating and rowing; whilst their operations are on land, and in the channels of locomotion where pleasure and business most have occasion to profit by using them.

The simple French velocipede does not seem to meet the entire satisfaction of Yankee inventive minds; yet while two fore-and-aft wheels are used, they are probably not capable of being much improved upon. The tendency of the mechanical horse to lie down upon his sides the moment he encounters anything to diminish his spirits, and the utter and complete weakening of which he becomes shamelessly guilty upon slight cause, render him a little unpopular with the timid; while the inexorable sprawling cranks prove offending to the dignified, who would move only to their own unmechanical rhythm and tact.

Invention is active in suggesting and making all kinds of improvements. The principal establishments at which velocipedes are now being manufactured in this city, are the Golden State, and the Ætna foundries, and Kimball's and Casebolt's carriage factories. French and Eastern velocipedes of the fore-and-aft style, have been imported to some extent, costing $60 currency in New York. They are also made at the Golden State Foundry, and at Kimball's carriage factory, at about $65, which is said to leave little margin for profit. The ordinary weight is fifty pounds.

Pickering's and Hanlon's are two Eastern patented improvements, relating to the manner of breaking, adjusting the seat, decreasing the weight, etc. Menon, is the name of one of the leading French manufacturers. In the Parisian races, the Americans have usually won.

At the Golden State Foundry there is to be seen a three-wheeled French treadle velocipede, with arm railings, between which two persons stand, operating with their feet. It travels along very imposingly where it can travel at all, but is pronounced not so practical as the two-wheeled mentioned. In the latter, slight modifications are being made; such as having the stirrup cranks of wood, the seat on differently shaped springs, etc.

Of the new inventions, at least half a dozen are in an incompleted state; some of them showing great ingenuity and the application of original principles in their construction.

At the Fulton and Ætna foundries there are several three-wheeled ones, in which a compound treadle, and the lever principle, are brought into practice; both in an original manner, concerning the details of which we are not at liberty to speak.

At Kimball's carriage factory, corner of Fourth and Perry streets, they are making the simplest velocipede of all that have thus far appeared. It is at the same time one of the cheapest, the most rapid, and barring a question or two of practical operation, promises to be one of the best. It has two wheels, five feet in diameter, running side by side, like a sulky. It will be suited for running in the horse railroad track.

A three-wheeled velocipede is being made at Kimball's, which does not appear to differ much from that at the Golden State Foundry.

At Casebolt's carriage factory, corner of Market and Fifth streets, there is a four-wheeled velocipede nearly completed, of which the driving wheels are ten feet in diameter. The inventor is Mr. N. Landry. It differs from the large one at Kimball's, simply in having the seat frame supported and prevented from oscillating, by an extra axle with wheels, and in being moved only by hand-power. This will cost $350.

On a fine evening a promenader will sometimes pass half a dozen velocipedes in half an hour on Bush street, and the Cliff House road.

MODIFICATION OF THE GERMAN PERCUSSION TABLE.—A. Schulenberg, of this city, formerly an employé in the pyrites concentration works at Mainz, on the Rhine, suggests an improvement on the cumbrous old German percussion table. He makes his slanting table shorter, and wider; instead of having one surface, he has three or four over one another, arranged in such a manner that the ore, after it has been washed on one, will precipitate itself over its upper edge, and the process is thus continued on the next below; so that the work of three or four concentrating tables is done on one. Mr. Schulenburg is undoubtedly practical in his ideas, and understands the matter he has in hand. In the percussion tables to which he has been accustomed, and which he has imitated in principle, the gangue is washed off to the lower end by the water, and the heavy mineral is caused by the percussion, to travel to the upper end, and to fall down over it without the necessity of shoveling. In separating pyrites from zincblende—minerals of very little difference in specific gravity, though the result is accomplished economically and very thoroughly—three or four shovelings from one table to another, are practiced by the Saxons. A great advantage of Mr. Schulenberg's table is, that he can apply a fresh stream of clear water to his washing intermediately in the process, on the several superimposed surfaces, which can be regulated independently, and from which the earthy particles are thus searched out much more delicately by the clean water applied. Letters will reach Mr. Schulenberg through the San Francisco Post Office.

HOWLAND'S NEW ENGINE.—Mr. W. H. Howland, one of the proprietors of the Miners' Foundry, in this city, has a four-cylinder engine operating with a new style of rotary valves, of his own invention, which is giving ample satisfaction. For simplicity, cheapness, and durability, so far as apparent it has no superior, and we shall observe its further testing with much interest. Mr. Howland has, on the same engine, a very compact and simple governor, possessing several points of improvement. Steps have been taken by the inventor to secure patents, and we shall have occasion to mention these inventions more fully at a future time, and probably with illustrations.

MINING TITLES.—A bill is before Congress proposing to extend the granting of fee simple titles, to placer claims, and it will undoubtedly be passed. The Schofield Gold and Silver Mining Company, located at Grass Valley, has obtained a fee simple title to 980 feet on the lode, with 150 feet on each side,—which is the first issued by the Government under the Act of July 26th, 1866.

CONTINENTAL Life Insurance Company, 023 Montgomery street, corner of Pine.

THE REGENTS of the State University—who meet again to-day—find themselves, after all, not so flush, financially, as it was arranged in the last Legislature that they should be, by turning on in order to put in motion the educational mill, a number of streams and streamlets from different sources, which flow through the State Controller's office. According to the report of the Finance Committee at the last meeting, the $200,000 which were to proceed from the sale of overflowed lands, are not forthcoming, because all those lands are claimed by private parties, with whom it would be necessary first to litigate. As $50,000 to $60,000 will be required during the first year, according to the published estimate, for furniture and apparatus, preparing and embellishing the grounds, forming the nucleus of a cabinet and for instruction, not to mention the expenses of the Board of Regents—leaving nothing wherewith to commence building the academic town,—it has been virtually decided that Berkley shall be postponed to a temporary futurity, and that the State University, after all, shall be and continue at Oakland, in name, though not in fact and outwardly, a different institution from the College of California. McClellan having refused to accept the Presidency, the names of Judge Hager, (one of the Board) Prof. John Le Conte, (one of the professors) Prof. Hart, of the N. Y. State Normal School, Prof. Timothy Dwight, Prof. George Davidson, of the Coast Survey, Prof. Cook, of Rutger's College, and Judge Deady, of Oregon, were proposed; but no action was taken thereupon.

OGDEN CITY, at the mouth of Weber Cañon, near the flat eastern shore of Salt Lake, is the gaol towards which the two Pacific Railroad companies are striving, with their mightiest efforts, first to complete their respective roads. The race is so nearly equal now, and the junction there is so natural and in accordance with the original design of the organization of the two companies, that Ogden City, we may take it, will be the meeting ground of the two armies. Being also the nearest point to Salt Lake,—a few hours' drive,—it is probable that Mormondom will be deluged with a class of more refractory subjects than the astute Brigham, with all his power, may know how to rule, or to manage. The Mormon leaders are very wise, but if they have not kept to themselves the ownership of lots at Ogden City, there is danger that Salt Lake City itself may, at no distant day, be overshadowed by rival influences. Strange sounds, and a strange activity for Salt Lake, are witnessed this winter in those weird cañons; and though it is the Mormons who are grading and building, the eastern and western gentile streams will flow into Ogden City as the brooks do into Salt Lake. Lead, from the smelting works at Cottonwood Cañon, and from Conner's mine, is awaiting shipment, via Ogden City. It is highly probable too that the valuable iron mines where Brigham has been proposing to erect furnaces, will be developed during the coming season.

THE COAL beyond Argenta, (the discovery of which was referred to in our Pacific Railroad article on November 21st,) is beginning to attract attention. The Nevada papers speak of excitement at Argenta and in Battle Mountain District, in regard to new discoveries recently made. A vein five feet thick is situated on the side of a mountain near Argenta. Several men are at work taking out the coal, which is of an excellent quality. Some of it has been tested as fuel for locomotives, and with good results. Dr. Harrison, of Crystal Peak, who has long been mining for coal in that vicinity, has been running a tunnel in the side of the mountain about a mile east of Verdi Station, and at a distance of 170 feet he has found a vein of coal three feet in thickness. A car load of the coal is to be sent to Sacramento. It is reported that another vein of good coal has been discovered on the line of the railroad, near Maggie's Creek.

Our Home Industries.

[From the Commercial Herald—Annual Review.]

WOOLEN MANUFACTURES.

The manufacture of woolen goods has steadily increased during the past year. The old established mills have run most of the time to the utmost extent of their capacity, while several new mills have also gone into successful operation. The demand for domestic-made woolens is steadily interfering with importations in their respective grades, while the local manufacture of clothing is also largely increased. All indications portend still greater activity in this branch of manufactures for the future, for which the speedy completion of the Pacific Railroad promises to open new and extensive markets in the interior of the continent, whose inhabitants will draw the bulk of their supplies from the Pacific coast. The speedy settling up of eastern Nevada with a very large population is assured by the discovery of immensely valuable mineral deposits at White Pine and that vicinity, and it is extremely probable that but a short time will elapse before similar valuable discoveries of mineral will be made in Utah, by which a vast emigration will be stimulated to that Territory from the Atlantic States.

In conjunction with these favorable prospects for manufactures on this coast, is an unusual disposition shown on the part of our people to engage in new manufacturing enterprises. The old prejudice against capital stock manufacturing companies seems to be slowly passing away, and the people of many of our interior towns are disposed to invest their local capital in woolen and other mills. It is to be hoped that this disposition to aggregate small capitals by our people in manufactories will continue to increase, as it will prove of immense value to the general prosperity of the State. California has all the adjuncts for success as well as the most favored States on the Atlantic side. She produces the raw material in abundance, has access to profitable markets and competent labor, and only needs the concentration of a portion of the capital of individuals to insure successful pecuniary returns. Nature has rarely gifted her in productive soil and healthful climate, and Providence has placed her in such position as to command a tribute for her industries from the lesser civilized nations bordering on the Pacific. It only needs a concentration of energies and purpose on the part of her people to develop a future of prosperity such as is not yet known in the history of any country. That this will be done, we cannot doubt; the energy and activity shown in the past by our people, though often misdirected, being ample proof.

The woolen mills located in San Francisco are the oldest in the State, and consume more wool and produce a greater variety and value of manufactures than all the other mills on the Pacific coast. The first to commence operations was the Pioneer Mills, located at Black Point, which, in 1859, manufactured the first blankets and flannels made in California. From that date, although once destroyed by fire, these mills have steadily increased their manufacturing capacity and quality and variety of goods. At the present time they have the most improved machinery in use, the produce consisting of all grades of blankets, flannels, plain and fancy, a great variety of cassimeres, tweeds, cloakings and the medium grades of broadcloths, finding a ready and profitable sale. The mill, during 1868, employed three hundred and fifty hands constantly, manufacturing 1,500,000 pounds fine wool, and turning out about $800,000 manufactures. The exhibition of goods made by these mills at the Sixth Industrial Fair of the Mechanics' Institute, in this city, in August and September last, was remarkable for variety and quality. The display, in connection with the other two local mills, occupied wall and floor room on the entire south side of the Pavillion, which was three hundred and twenty feet long, besides several large tables, which were in the vicinity. The woolen goods exhibition was a constant source of wonder and delight to visitors, and gave them a most comprehensive idea of the extent and value of their local industry.

The Mission Woolen Mills, located at the corner of Sixteenth and Folsom streets, commenced operations in 1861, and has, without interruption, continued manufacturing since that date. From making blankets and plain flannels, the range of manufactures has extended to producing all grades of those goods, as well as cassimeres, tweeds, cloakings, traveling and tartan shawls, buggy robes, army and navy broadcloths, etc., besides occasional varieties, such as super and ingrain carpets, which last were the only ones ever made on the Pacific coast. One of the most valuable features connected with these mills has been the individual enterprise of their founder, Donald McLellan, who has been the first to manufacture new varieties of goods, risking a successful market in the face of strong competition with importations. In this particular it is gratifying to state that the results have always been favorable, and that his business sagacity has been pecuniarily rewarded. At both the Industrial Exhibitions of the Mechanics' Institute, held in this city during 1864 and 1868, the display of manufactures of the Mission Woolen Mills were unsurpassed in their department, and at the World's Fair at Paris in 1867, the blankets and flannels exhibited by them obtained the highest prize over all other competitors from the Atlantic States. The Mission Woolen Mills has about twenty per cent. less machinery than the Pioneer Mills, but running most of the time day and night, consumes as much raw material and labor. In 1868 they employed four hundred and fifty hands, used 1,500,000 pounds wool, which made $800,000 value in manufactured goods.

The Pacific Woolen Mills is the only one making knit goods for underwear on the Pacific coast. The works are on Folsom, between Eighteenth and Nineteenth streets, and give employment, in the building and outside, to over five hundred operatives. The machinery is of the latest improved kinds, and it is claimed that they not only produce a greater range of varieties and qualities of goods than any other mill, but some styles, which for fineness and value, are not made elsewhere in the United States. Although operations were only commenced in June, 1867, the mills have found a steady and profitable market for their goods, which are gaining ground wherever known, as against importations. During 1868 the Pacific Woolen Mills used 300,000 pounds of the finest class of wool raised in this State and Oregon, besides importing some of a still finer quality from Australia. The total value of manufactures during the same period was about $300,000, which amount, in consequence of additional machinery received lately, will probably be much increased during the present year. The Pacific Woolen Mills were awarded a gold medal at the Mechanics' Fair in 1868, for the excellence of their manufactures.

The other woolen mills in the State are the Woolen Mills at Marysville, the Capitol Woolen Mills at Sacramento, and the Merced Woolen Mills on the Stanislaus river. The Marysville Woolen Mills have been in operation for a little more than a year. They are known as a three-set mill, and making mostly flannels and blankets, produced about $175,000 manufactures in 1868. The goods are of excellent quality, and find a ready sale.

The Capitol Woolen Mills commenced operations in September, running only a portion of their machinery. They are known as a four-set mill, and will manufacture about $200,000 per annum. Their manufactures, so far, have been confined to blankets and flannels, but when in complete operation they will make cloths, cassimeres and tweeds, as well.

The Merced Woolen Mills have only been in operation for a few months. They are known as a four-set mill, with about the same manufacturing capacity as the Capitol Mills.

The oldest woolen manufactory on the Pacific coast is the Willamet Woolen Mills in Oregon, which commenced operations in 1857. The Oregon City, Ellendale and Eagle Mills, in the same State, have been in operation for several years, and another mill is reported as being about to commence operations. The entire mills in Oregon in 1868, consumed about 1,000,000 pounds wool, their manufactures being valued at about $600,000. They make a great variety of goods, the larger part of which supplies a profitable local demand, comparatively small amounts being sent to San Francisco.

Several small woolen mills are projected in California, which will probably commence operations during the present year. The amount of capital in each varies from $20,000 to $50,000, and their manufactures will, at first, be confined to blankets and flannels. One of the mills will be at Santa Rosa, Sonoma county; another at Colusa, and a third at Stockton.

COTTON MANUFACTURES.

The only cotton mills on the Pacific coast are the Oakland Cotton Mills, located in that city, in Alameda county. The inability of obtaining a supply of California-grown cotton and the difficulties attending importing from Mexican and other ports on the Pacific or from New York, have comparatively crippled the operations of these mills since their erection. Besides producing sheetings, shirtings and drilling, these mills have made considerable quantities of cotton and wool tweeds, for which there has been an extensive demand. Owing, however, to the difficulty in obtaining supplies of raw cotton, the mills are to be used in manufacturing flax and hemp bagging, for which there is an immense demand for grain and wool purposes.

FLAX AND HEMP BAGGING.

As above stated, the Oakland Cotton Mills are to be altered so as to manufacture flax and hemp bagging. Suitable machinery has been imported from Dundee, Scotland, a portion of which arrived, with a number of skillful operatives in the ship Santa Lucia, in December, 1868. Measures have been taken to secure a supply of jute hemp from Calcutta and flax in California, so that manufacturing can be engaged in during the year. The consumption of bagging for grain and wool sacks in California has already attained immense proportions, and promises to largely increase. It will be of great advantage to stop a drain of treasure, estimated at $2,000,000 annually, and at the same time a new branch of employment given to our people. Large as the demand has been for both grain and wool sacks, the vast increase in both, and more especially in the production of the former in California, insure a profitable investment for capital in manufacturing, which will require a number of large mills to supply. The facilities for procuring a supply of flax fibre suited for the purpose are ample, many of the farmers of the coast counties having already engaged in flax culture for seed only, with profitable results. Heretofore, the straw which contains the fibre, has been burned, there being no sale for it. It has been found, through repeated trials, that the fibre can be separated very easily and cheaply from the straw, and it is believed that an abundance of the latter can be had at low price, if desired.

FRUITS, NUTS, ETC.

The crop of dried and nut fruits during 1868 have either not been as large as in preceding years, or they have, to a greater extent than usual, been absorbed by a local demand. No State of the Union possesses a more generous soil or favorable climate for the production of fruit, those of a semi-tropical as well as temperate zone being grown to a high degree of excellence. Almonds of all kinds are a sure and plentiful crop in all the valley lands of the State, with the exception of a few localities that are subject to very late frosts, by which the more tender varieties are sometimes destroyed. In the Southern counties, such as San Luis Obispo, Santa Barbara, Los Angeles, San Bernardino, and San Diego, the climate and soil are peculiarly suited to growing almonds, and it is very probable they will in time be produced as largely as now in the south of France. With the large emigration continued that has set in within the last twelve months, those counties are sure to make great progress in growing the finer and more valuable varieties of fruit, among which almonds will take high rank. The speedy completion of the Pacific Railroad promises to soon increase the population of the States and Territories in the interior of the continent, of which the westernmost portion, or fully one-half the population, must draw their imported supplies from the Pacific coast. There is virtually no limit to the demand that will soon arise for semi-tropical fruit in the interior, and aside from its superior freshness and flavor, California, by her position, possesses many advantages over New York or other Atlantic ports in supplying them.

The Maderia, or so-called English walnut is a very prolific bearer, and is largely cultivated throughout the State. The amount of the crop for 1868 is not known, but must be considerable, as very large numbers of trees have lately come into bearing. The tree requires very little attention, is of fine appearance, and the fruit, on account of its superior freshness, sells for nearly double the price of the best imported. Large numbers of the trees are in consequence being planted by farmers and others. There is very good reason to believe that at the rate the cultivation of this nut is progressing, California will be able to supply the entire demand of the United States before the close of the present century.

Another species of nut culture that is about being engaged in, is that of the Japanese or Italian chestnut. This fruit has been grown from seed, in very limited quantities, for two years past. During December, 1868, a considerable number of trees have been imported from Japan, and arrived in comparatively good order. The trees were mostly dwarfs, having been budded on other stock, and will therefore soon come to maturity, a portion of them having already borne fruit before shipment. At present the importation of the fruit from Japan is so precarious that it has been abandoned, scarcely one invoice out of ten arriving in fair order. The Italian nuts have to be kept until several months after harvest, or be kiln dried, to admit of shipment with safety across the Atlantic. California will virtually have a monopoly of the domestic raised fruit which can be transported by rail from October until May without damage. Attempts have been made to grow the various nut fruits of the Atlantic States, but with exception of the common chestnut, very little success has been had. The fault is said to arise from the vitality of the seed being destroyed by heating while on the voyage via Panama.

Oranges are now grown with good success in almost all the valley counties of the State, the fruit even in 39 degrees of latitude ripening in the open air in January and February. A large number of trees, mostly in the southern counties, are in full bearing, the crop of 1868 being sufficient in quantity to supply the markets from January 1st to May following. The tree is being extensively planted, and the fruit has so far been very remunerative to growers. Besides the native lemon, which was introduced by the priests soon after the establishment of the various Missions in the southern portion of the State, quite a large number of trees have, within the past ten years, been raised from Sicilian and Malaga seed. The last two varieties have attained in California a perfection of size, color, aroma, and flavor that far exceeds the original fruit as imported, and in time the crop will increase so as to fully take its place. Limes grown from imported seed also improve upon their original stock in both size and flavor. The production is as yet limited, but the culture is largely increasing in several of the southern counties, where the tree seems to thrive especially well. Citron, the prepared peel of which is the fruit known by that name to commerce, grows in great abundance in the southern part of the State. The fruit is generally of unusual large size, single specimens having been brought to San Francisco weighing 46 ounces. With exception of a small quantity that is sent to San Francisco for exhibition, the whole production of citron is annually allowed to rot. No attempts, so far as known, have been made to preserve the fruit for either domestic use or export, although the process is said to be simple and not very costly. The annual consumption of the citron of commerce in the entire United States could, within ten years, be supplied by California produce, if men of intelligence and energy would engage in its manufacture.

Prunes of both the German and French varieties have been grown to some extent in California, comparatively large quantities of each kind having been dried for home consumption. The fruit grows to a large size, and the probabilities favor its increased production until importations cease. Olives have been planted, and thriven well at some of the Missions almost from the date of their being founded. The tree is not unfavorably affected by our winter cold, is easy propogated, and bears an abundant crop. There is a large field for the successful cultivation of this fruit to supply the local demand, as well as that of the rest of the Union.

In domestic dried fruits, such as apples, pears, peaches, plums, etc., quite a large amount is annually made. The fruit is of excellent quality, and finds a ready and remunerative market. All kinds of figs have been grown in the State with great success, but with exception of the native blue, or California fig, no quantities of any importance have been dried for market. Dried black or Zante currants have been produced in limited quantities during the past two years. The fruit raised is reported of excellent flavor and size, while its freedom from dirt or gravel gives it still greater advantages over the foreign article. The grape from which the Zante currants are made is known as the seedless Black Corinth, and is a remarkably vigor-

ous and prolific bearer. The propogation of tbe vine is being largely engaged in, and not many years will pass before tbe native cured fruit will be common in our market.

Tbe crop of California raisins for 1868 is said to be the smallest known since tbe business was first engaged in. Tbis has been owing to two causes, one of wbich has been the excessive importations of Malaga fruit during the last two years, which have glutted the market, and also to difficulty experienced in curing the domestic fruit without an extensive and costly system of kilns or drying houses. These last are rendered necessary to protect the fruit in drying from dews or slight rains which then often prevail. During the time of drying, a fall of rain scarcely wetting the surface of the ground sufficient to lay the dust, proves entirely ruinous to raisins, which tben are only fit for distilling. During the drying seasons of 1866 and 1867, B. N. Bugbey, of Folsom, who was the largest grower in the State, lost over 2,000 boxes of raisins through the prevalence of slight showers. As the business was so precarious, without large outlay for building, this gentleman only made a few boxes in 1868, turning his grapes into wine and brandy as being more profitable. There is but little doubt that the curing of raisins will ultimately become a large business, but capital will have to become more abundant and at lesser rates of interest to encourage growers in incurring large expenses for necessary fixtures.

The returns of county Assessors for 1867 give the following items regarding fruit trees in the State, viz.: Apple, 2,249,473 trees, the largest counties being Santa Clara 722,000, Sonoma 255,280, Shasta 232,340; peach trees, 984,621, the largest counties, Sacramento 74,300, El Dorado 56,200, Sonoma 52,912 trees; lemon trees, 3,700 (Malaga and Sicily varieties,) of wbicb Los Angeles has 2,300; orange trees, 17,397, largest county, Los Angeles, 15,000; and olive trees, 14,812, largest county, Santa Barbara, 12,000.

HOPS.

The culture of hops in this State is attended by so many favorable circumstances of soil and climate that it has proved quite successful to all wbo have engaged in the business. Hop growers find in all valley land (except in some localities along the coast) a perfect freedom from fog or dampness during the summer season, which protects the plant from mildew, blight, or insects, all of which are common and injurious in the Atlantic and so-called Western States, as well as in England and other hop growing countries in Europe. Hops grow well in all soils, both on river bottoms and uplands, the crops in the former being heavier and less delicate in flavor, while the yield in the latter is about one-third less, but of milder and better quality for several purposes. Another advantage in California hop growing is the almost entire absence of heavy storms of wind, which in the other States often do great damage by prostrating the vines to the ground, and frequently injuring them seriously. The plants in river bottoms often yield 1,000 pounds cured hops to the acre during the first year after planting, and frequently double that amount the next season. Some individual acres have been known to yield over 4,000 pounds after the second year, but such product is very uncommon. On tbe lighter soil of the uplands the general yield, under favorable circumstances, ranges from 1,300 to 1,500 pounds to the acre for the second year.

Tbo crop of hops in the State during 1867 is reported by the County Assessors as having been 560,407 pounds, the yield of 987 acres planted. Sacramento produced the largest amount of any one county, the yield being 412,500 pounds, from 430 acres. With the favorable circumstances noted above for hop culture, the opportunities for brewing, and markets for beer of all kinds, have no superiors elsewhere. The climate of San Francisco is equable to a remarkable extent, and brewing can be successfully engaged in on any month of the year. All the necessaries of water and good malt can be had to perfection, and the markets of foreign countries bordering on the Pacific are easy of access, and should be supplied from California instead of England and Germany, as at present. That this great field of enterprise will long continue to be unprofitably neglected by California brewers is not likely, nor will our hop growers bo confined to supplying the requirements of the local market. The continued and great increase of diseases among hops in the other States of the Union is being seconded by similar disasters in Great Britain and otber countries in Europe. The growing of hops is becoming a quite precarious business in most countries, and the superior climate and productive soil of tbis State will in time be drawn on to make good the deficiencies in tbe crops produced elsewhere.

One of the most valuable adjuncts to hop raising is tbe patent hop-kiln, invented in 1867, by Capt. Wm. M. Haynie, of Sacramento. The peculiar advantages claimed and proven for this kiln are, that when the green hops are once placed to dry, there is no sboveling or bandling them afterwards, even in bailing. The time of drying is also shortened fully one-third, so that three kilns can be dried in place of two, by the old method. Brewers will appreciate the value of the Haynie kiln, when we state tbat tbe hops are as perfect in form in the bale as they were before drying, each blossom being unbroken and containing all its lupuline and seeds. The perfection of the process has astonished all parties who have seen the hops in bale in this city. The advantages of the new kiln will, in time, cause its general use in all tbe hop districts of the United States, and largely increase the value of American hops by their perfect condition for export. We have no correct date as to the hop crop of 1868; it was, however, largely in excess of previous years, and prices, tbus far, low and unremunerative.

DAIRY PRODUCTS.

California, from the commencement of the gold excitement, caused by tbe discovery of the precious metal, has as a great agricultural country, stood in an anomalous condition regarding her dairy products. Rich in indiginous grasses of unusually nutricious qualities, and with an abundance of good stock, she has annually paid millions of dollars for imported butter and cheese. Instances were not common, a few years ago, where farmers owning large numbers of stock were too indolent to procure milk for their tea or coffee, while the butter and cheese purchased for their family's use were imported from New York or other Atlantic ports. Those who were the first to turn their attention to making butter and cheese have, as a rule, been well repaid for their energy and good judgment. Many others have since followed their example, but still over twenty-five per cent. of both butter and cheese are imported from Atlantic ports to supply our people. Great progress has, however, been made towards a general disposition on the part of our small farmers to make more or less butter and cheese for sale as well as home use, and the time is not far distant when importations will become so unprofitable as to cease. Along through tbe coast counties the advantages for making both butter and cheese are very great, the grass, from provalence of moist fogs, remaining green and succulent almost all through the year. Another feature connected with the present dairying in California, as compared with previous years, is found in the general improvement of quality of both butter and cheese made.

Our Ship Building Interest.

In the Treasury report, recently published, considerable stress is laid upon the extensive consumption of sbip building woods on the Atlantic coast, but, strange to say, no allusion is made to the vast forests still standing in primeval integrity upon the Pacific coast, and furnishing the very best timber for naval architecture. Nor are our almost illimitable resources for marine uses taken into consideration.—Sheltered coves and small, safe harbors abound along the coast of Washington Territory, where the forests grow close to the shores. Pitch, tar, turpentine and rosin are supplied in profusion by those forests; the great size of the trees furnish timber suitable for ships of any required tonnage; iron and copper are abundant; hemp and flax thrive in our soil; tbe climate permits out-door work all the year round; spars of the finest quality are cheap and plentiful; wages are somewhat higher, but the depreciated cost of materials more than counterbalance tbis item. Several first class vessels have been turned out here the past year at two-thirds what it would have cost to construct them of poorer materials in the Eastern States. These facts are known and being availed of by our merchants and ship builders, and the purchase of Eastern built vessels has about ceased in tbis section of the Union. Our ship building interests made good progress throughout the past year. Our yards were well employed, and a number of excellent vessels constructed at various points in Puget Sound. This industry is destined to become of leading importance, and will enable our Pacific possessions to do the carrying trade of this ocean.

During the past year seven thousand six hundred and four tons of new shipping, built on this coast, were registered at the Custom House, represented in tbe following manner, viz: eleven steamers, registering 3,132 tons; three barkentines, aggregating 793 tons; one brig, of 173 tons; four barges, of 798 tons; thirty-four schooners, comprising 2,628 tons, and four sloops of 80 tons, being a total of fifty-seven vessels.

Our Railroads.

Central Pacific.—This road is now completed to a distance of about five hundred miles from Sacramento, three hundred and sixty miles of wbich have been constructed during the year 1868—three hundred and twenty miles having been laid since the first day of July, 1868. The track is now being laid at the rate of from two to three miles per day; and Salt Lake, it is expected, will be reached sometime in March, and the entire line completed within three or four months thereafter.

California Central.—During the past year tbis road has been sold under the foreclosure of a mortgage, and it is now operated by the Central Pacific Railroad Company.

Western Pacific.—The grading of this road is nearly completed, and track-laying having been entered upon with vigor, will probably be completed inside of three months.

California and Oregon.—The work of constructing this road north of Marysville will be commenced as soon as the bridge across tbe Yuba river at Marysville, is completed, which will probably be in a few weeks. It will probably be completed as far as Chico in 1869.

California Pacific.—Now completed from Vallejo to Sacramento, 60 miles, with branch to Marysville, to be constructed the coming summer. Running time, 2½ hours. The average number of passengers daily is 220. The Napa Valley Railroad Company have just completed their line to a junction with the California Pacific, about seven miles north of Vallejo, and will run their cars from Calistoga, Napa, etc., over this road to Vallejo.

The Oakland and San Francisco.—Extends from the end of the wharf west of Oakland to Brooklyn, a distance of 4 miles.

San Francisco and Alameda.—Length now being operated, sixteen and a half miles, viz: From Alameda Point, on the Bay of San Francisco, to Hayward's. A steamboat line is run in connection with the road, the distance of water travel being five and thirty one-hundredths miles. It is intended to throw out two branches of this line from Hayward's to intercept the Western Pacific Railroad—one connecting in that part of Alameda County known as Amador Valley, and the other in the Southern part of the Alameda Valley, about fifteen miles from San José.

San Francisco and San Jose.—Extends between these two cities, a distance of fifty miles.

Napa Valley.—Road runs from a junction with the California Pacific Railroad, seven miles north of Vallejo, to Calistoga, a distance of thirty-five miles, via Suscol, Napa, St. Helena, etc.

San Jose and Gilroy.—Thirty miles long; the whole line graded and track laid down for fifteen miles. The whole will be completed, and the cars running by the last of February.

Steam Trade with China and Japan.

Our steam trade with China and Japan has been actively prosecuted by the Pacific Mail Steamship Company during the past year. It is considered so important that the Post Master General, in his annual report, presses upon the Government the necessity for establishing a semi-monthly line between this city, Japan and China. The steamers employed in this trade are the largest and finest in the world, reflecting honor upon the company which has undergone unusual expenditures to render them acceptable to the traveling and business public. It is certainly good cause for indulging in a little boast to say with truth, that tbe steamers connecting San Francisco with Oriental ports are unequaled. Another such ship as the China, Japan and Great Republic, the America, built expressly for the line under consideration, and equaling her predecessors in all respects, will sail from New York in April next, and upon arrival, will commence regular trips to Japan and back, the connection between Yokohama and Hongkong being performed by the first class steamers New York and Costa Rica. In 1868 the Japan and China line of steamships made ten voyages outward, the average time being 28 days and 21 hours to Hongkong, the trip to Yokohama occupying 22 days and nine hours, and the connection with Hongkong, 6 days and 12 hours. Return voyages averaged 29 days and 22 hours, requiring one day more, in consequence of prevailing contrary winds and currents. The amount of treasure shipped by this line in 1868 was $6,743,672, the total number of passengers carried hence in the same time was 4,033, including 239 in the cabin; the number of tons of freight transported from this city reached 6,356 tons, at an average cost of $12 per ton. The return voyages were nine in number, occupying an average of 29 days and 22 hours, for the reasons above given, which operate chiefly in the Yellow sea, between Hongkong and Yokohama. The number of passengers arriving in these steamers was 6,061, including 459 in the cabin, and the tons of freight brought amounted to 11,939, at an average of $12 per ton. These figures show 18,295 tons of freight; 10,095 passengers, including 696 in the cabin, and $6,700,000, in round numbers, passing between San Francisco and the Oriental ports named, on the steamship line in 1868. The freight gains, according to the foregoing statements, amounted to $219,540; the returns for passenger service were as follows, viz: for 696 cabin passengers, $208,800; for 9,398 steerage passengers, mostly Chinese, at $40 per head, $375,920, making a total of $804,260. This does not include the percentage paid on nearly seven millions of treasure. The importance of this steamship line can scarcely be overestimated. Our relations with Eastern Asia have received an impulse, through its means, altogether unknown before. Chinese and Japanese seclusiveness have given way before its assaults, and a spirit of amity and confidence engendered between the American people and Asiatics, which promises to result in the greatest good to all. The very first trip made by the pioneer ship, the Colorado, enlarged our traffic with Japan to such an extent that our imports on that one occasion were more than three times as large as during the whole first quarter of 1866. The trade in precious metals, which are so largely absorbed by Oriental countries, must eventually fall into our hands instead of going by way of London, and a great change has already been realized in this respect. To gain possession of this traffic is to obtain commercial supremacy, which involves financial and all material prosperity. In view of this fact, it is not strange that the Post Master General should be so urgent in his recommendation to establish a semi-monthly steam line between San Francisco and Oriental ports.

Rough Times Ahead.—The Nevada papers anticipate that the wilderness will be scoured in every direction, next summer, for hundreds of miles by keen-eyed prospectors, and say it will be strange if some remarkable discoveries are not made before the fall. Large parties will organize and range through the wild, unknown regions lying southward, where the Indians have heretofore successfully resisted the entrance of small parties.

Stage Line from Maggie Creek to White Pine.—Hill Beachy is about to place a line of stages on between Carlin or Maggie's Creek and the White Pine District. He will use the stock and stages that were on the Idaho route between Hunter's and Winnemucca, the latter place being now the starting point for Idaho. Other lines to White Pine, from different stations on the railroad, are spoken of.

Sumac could be grown with profit in the foothills of the Sierra Nevada and on the plains. It requires neither richness or much moisture in the soil. The leaves contain a large proportion of tanuic acid, and are worth from $80 to $100 per ton. Its strength is said to be proportioned to the amount of sunshine. Suckers are planted in hills 2½ feet apart each way. Fredericksburg is one of the chief centers of the sumac cultivation in Virginia. It should yield at least a ton to the acre.

Madder yields about $150 to the acre in Italy, but it requires a rich, light soil and very laborious cultivation. The adulterations and high cost of the imported article might enable the woolen mills and dyers to pay enough to justify cultivation here.

THE CHEMISTRY OF FURNITURE.—Housekeepers do not always understand the theory of the chemical and mechanical action of different substances on articles of furniture. The substances from which furniture are chiefly exposed to injury are water, oils, alcohols, and acids. Acids act on marble, which is composed of carbonate of lime, destroying the texture of the stone—liberating the carbonic acid, and leaving nitrate of lime, or muriate of lime, or sulphate, or acetate of lime, as the case may be, in the form of a white powder. All varnished or polished surfaces of wood, on the other hand, while not injured usually by acids, are attacked by alcohol. Varnishes are composed of different gums and resins, which are generally soluble in alcohol. Many of them are made by dissolving the materials in alcohol so as to liquefy them, and then, when they are applied, the alcohol evaporates, leaving the gum or resin in a thin, even coating over the surface. If any alcoholic substance comes upon such a surface, whether it be alcohol itself, as used for lamps, or spirits of any kind, or even wine, which contains but a small percentage of alcohol, a portion of it is dissolved, and the brilliancy of the surface is destroyed. Oils will not attack either marble or varnished surfaces, and will do no injury except to naked wood or other porous substances which admit them into the pores, from which they cannot afterward be easily expelled. Water affects no substances except such as have open pores exposed, in which case it enters and causes the substance to swell; or such as are soluble in water, as glue in joints, and mucilage or gum arabic, used sometimes for attaching superficial ornaments for fancy work.

THE LAKE SUPERIOR COPPER interest feel sure of reciving protection from Congress. Five or six mines have yielded largely in quantity, but at non-paying rates, a number of smaller mines have been abandoned, and it is contended that if the proposed duties on ores of three cents a pound pure copper, and of five cents a pound on ingot is not carried, the whole mining industry is jeopardized. The Atlantic smelters have produced very little, and with a higher duty they would find it difficult to work to advantage.—*Winterhoff's Metal Circular.*

MINERS are paid from $4 to $6 per day in Montana Territory.

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer.
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and figures made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me. 5v17-1y

Removal and Partnership.

Notice is hereby given, that I have removed from my old stand on Beale street, and have formed a co-partnership with Mr. A. CAMERON, for the purpose of carrying on the business of Stair-Building, Wood-Turning and Scroll Sawing. The business will be conducted as formerly at Cameron's, corner of Market and Beale streets, and also at Nos 485 and 487 Fremont street, where ample steam power and all necessary facilities have been provided for every branch of the business.

Different sizes of Redwood Balusters constantly on hand for sale. Also Spanish Cedar, Walnut and California Laurel.

15v17-3m N. P. LANGLAND.

Enterprises and Developments.

A SPRING BED factory has been established in Sacramento.

ONE MILLION feet of fencing is sold in San Diego per week.

NEW gas works have been erected at Helena, Montana.

EIGHT HUNDRED gang plows have been sold at Stockton during the past season.

THE Suisun and Fairfield Water Company recently declared a dividend of $4.50 per share.

GOLD FISH.—A lucrative, if not very important business, is done in a small way in the importation of gold fish from the Sandwich Islands. They are easily raised near Honolulu by a French enthusiast in the business, and brought over in barrels aud tiu caus, with the loss of a very small percentage.

GRANULATION OF CALIFORNIA SORGHUM. A notable experiment with sorghum has been made this year near Alviso, on 120 acres planted on contract with J. H. Purdy in June—too late to get all the moisture needed. Thus the crop was a partial failure, but the quality of the syrup obtained is excellent; it granulates readily, and has a fine flavor. The experiment will be repeated this year under more favorable circumstances.

CHESTNUTS, WALNUTS AND PECANS.—Childs & Co., of Los Angeles, have succeeded in growing the Italian chestnut, having trees now twelve years old, producing nuts of immense size and fine flavor. Small trees can be had of them for transplantiug.

The pecau, a southern forest tree, even more valuable than the chestnut for its nuts, is also grown by Childs & Co., and the Americau chestnut aud Western walnut—unlike the California black walnut, and superior to it—are also growing thriftily in their garden.

MANUFACTURES IN THE INTERIOR—WOOLEN MILLS.—The Marysville *Appeal* regards the future of that city as depeuding upon its maunfactures. It urges the establishment of another woolen mill there, sayiug that the present one has more orders than it can fill. There are, it says over 500 woolen mills in six States of Ohio, Michigan, Indiana, Wisconsin, Iowa, and Minnesota. There are but five or six woolen mills in operations on this coast, yet Eastern and foreign manufacturers do not feel the least check to their shipments. Califoruia, Nevada, Oregon, etc., it asserts, will soou afford a market for fifty woolen mills.

Oroville, Sacramento, aud Merced Falls now have their woolen mills, aud another is proposed in Tulare County. The Visalia *Delta* says: "Such an enterprise will pay better in Tulare County than in any other section of California. It will not only pay large profits, but it will create a home market for our wool, which is greatly needed. A capital of $20,000 or $30,000, raised by subscription in shares, would start a fair woolen mill, aud would prove one of the best payiug iuvestments in the State." The Butte County *Record* prophecies that Oroville will be, at no distant day, the Lowell of the Pacific Coast.

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, counecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK:

On the 9th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. M. S. S. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR JANUARY, 1869.

The following Steamships will be dispatched on dates as given below:

January 6th—SACRAMENTO.. .....Capt. W. H. Parker, Connecting with ALASKA, Capt. Gray.
January 14th—MONTANA..... ....Captain A. We Connecting with RISING STAR, Capt. King.
January 22d—CONSTITUTION.....Capt. Wm. H. Hudson Connecting with HENRY CHAUNCEY, Capt. Connor.
January 30th—GOLDEN CITY.....Capt. W. F. Lapidge, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—it desired an amount of $50 to $20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched on MONDAY, January 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Knox's Amalgamators,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.
Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13vt0qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.
Pacific Iron Works.
First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:
STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine use.
BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.
Quartz Mill Work,
Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.
Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Halsbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.
Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Valuable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.
GODDARD & CO.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 510 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of ill-ease, instead of by the round about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have received, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to
D. D. T. NESTELL, A. M., M. D.,
Lung Institute,
No. 516 Sutter Street, San Francisco,

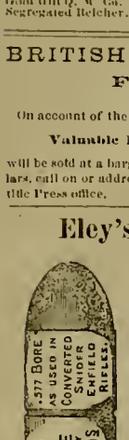
BRITISH PATENT RIGHT FOR SALE.

On account of the decease of a patentee, one half of a

Valuable Patent for Great Britain

will be sold at a bargain if applied for soon For particulars, call on or address "ORDNANCE," Mining and Scientific Press office. 3tr18-tm

Eley's Ammunition.



These Cartridges are made in three sizes, viz: .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and unperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .450 bore for Revolving Pistols, to use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 m, 9 m, and 7 m, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

And in accordance with law, and an order of the Board of Trustees, made on the ninth day of November, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J. C. Merrill & Co., auctioneers, No. 204 California street, San Francisco, California, on Saturday, the second day of January, 1869, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

ENOS TAYLOR, Secretary.
Office, No. 226 Clay street, San Francisco. dec19

POSTPONEMENT.—The above sale is hereby postponed until Saturday, the thirtieth day of January, 1869, at the same hour and place. By order of the Board of Trustees.
jan9 ENOS TAYLOR, Secretary.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to the public to warrant publication.

Machinery.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is throwu to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the orc is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION

PATENT

Variety Molding and Planing

MACHINE.

THIS STANOARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

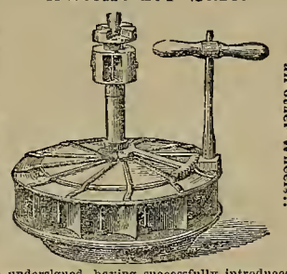
Patent for Sale.

The Best Wheel in the World!



Triumphant in every Test with all other Wheels!!

The undersigned, having successfully introduced the

Leffel American Double Turbine Water Wheel

On this Coast, and owning the Patent for the whole Pacific Coast, viz: The States of California, Nevada and Oregon, and the Territories of Arizona, Washington, Idaho, and Western Montana, wishes now to dispose of the Patent, with stock of Wheels on hand, Patterns, etc., etc.

A Company organized and prepared properly for the construction of these Wheels, to supply this Coast and all tributary countries, could make the business immensely profitable.

My object in selling is to enable me to devote myself exclusively to my profession. A. MYERS.

P. S.—If not sold previous to February 15th, then I would enter into an arrangement to manufacture by paying royalty. Address Rev. A. MYERS, Portland Oregon.

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and languages, is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send thither, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Montgomery Block. Prompt action is necessary.

PATENT

Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Fire, Hose and Machine Belting.

THE SUBSCRIBER CONTINUES TO MANUFACTURE Oak Tanned Leather Fire Hose, warranted superior to Eastern Hose, manufactured at the Sixth Street Tannery, San Francisco.

21v16tf JOHN J. FULTON.

Turbine Water Wheels.

[Continued from page 1.]

The Jonval, Lind and Tyler turbines, (French, California and New Englaud inventions respectively,) furnish the highest percentage of absolute power in the order named, and are cheap in proportion to the power furnished in the reverse order. Both the Lind and Tyler are central discharge wheels, the water feeding from the periphery and dischargiug in the center. The Leffel wheel is used considerably in the East; it resembles the Jonval. The Belden is a central discharge wheel similar to the Tyler, but not as good. The Scotch turbine receives its water in the center and discharges in the periphery, like the reaction wheels mentioned below.

The hurdy-gurdy, resembliug the Swiss turbiue, is a very simple tangental turbine, much used in the gravel miues for crushing cemeut, pumping and prospecting, as it can be fixed on the end of a cam shaft, aud driven at once with the hydraulic hose-pipe.

Water wheels have been worked by the Englishman Fairbairn to 93 per cent of the absolute power in the falling water, but it is safe, ordinarily, in reckoning out the horse power, to estimate the practical efficiency at 55 to 60 per cent.

The principal objection to turbines is that gritty, muddy water wears them out. Over-shot water wheels suffer injury from standing still, and they cannot be used to advantage over 40 feet in diameter.

Reaction wheels are those working on the principle of Mattieson's hydraulic crane, or the "Barker mill," invented in the 17th century. Whitlow's Scotch turbine is on the same principle. They are adapted to a still smaller stream with greater fall, than the ordinary turbines, and will afford 50 per cent of the absolute power in the water used.

The water engine proper, is a valve machine which works precisely like a steam engine, with a column of water as the operating agent, in the place of the steam. A toy engine of this kind is in operation in one of the churches of this city, where it is used to drive the bellows of an organ. The water engine is much used in the Saxon and Bohemian mines, where they are of colossal size, being generally employed to do the pumping, whereby the falling of a streamlet from one level to another, underground, is made use of to pump the waters from below up to the adit level. At Joachimsthal the water engine is used also for hoisting. The principal advantage claimed for it is that it never wears out; though the leather of the valves is apt to be attacked by acid waters. Tomlinson describes it in his Encyclopedia of the Useful Arts.

Of the available water power in the foothills of the Sierra,—within a distance north and south of 500 miles which has more than twenty large rivers falling at least 6,000 feet in 70 or 80 miles,—Cronise, in his *Natural Wealth of California*, says:

"To state it as being equal to the force exerted by 500,000 horses would be to keep well within bounds. Already nearly 200 quartz mills, over 50 flour, and 150 saw mills, are driven by such inconsiderable portions thereof as have been diverted for this purpose. If all the water power existing in the New England States were added to that of New York, New Jersey, and Delaware, it would scarcely exceed that still running to waste down the side of the Sierra."

On the Truckee, at its lowest stage, according to a rough estimate by Mr. Scott, of the Union Foundry, there is available about 1,000-horse power per mile. There being 70 miles, having an average fall of 45 feet per mile, the Pacific Railroad and Nevada have at their service not less than 70,000-horse power in that stream alone.

THIS year for the first time, so far as known, the basket willow grown in California has been put to use.

COLORING EARTHS.—A correspondent from the Olmstead paint mines in Sonoma County, taking exception to our article quoted from Ross Brown's "Mineral Resources," etc., on account of its omission of that important development, says:

We have been working our paint mine, more or less, for two years, and have distributed our colors over Sonoma County, and several tons in San Francisco, nearly a ton in Sacramento, also in San Luis Obispo; and we have had our paints on exhibition at three fairs—at the Sonoma County Fair, Mechanics' Institute Fair, San Francisco, and the State Fair, at Sacramento—and been awarded a premium at each place; and all those, whether painters or paint dealers, that have examined our paints, tell us that they are the first genuine fine paints they have seen, of California production. Mr. J. D. Oliver, of San Francisco, on examining our paints, said that all the California paints he had seen before were too coarse, but ours is fine enough; and that is the question raised by all good judges that have used or seen our native paints and colors.

Olmstead's paints were spoken of in the PRESS, in connection with the Mechanics' Institute Fair.

THE FIRST NOTICE AT THE EBERHARDT MINE.—The following curious document is said to have been posted at the Eberhardt mine:

White Pine District, Aug. 5th, 1867: Know all men (or one women, for then all will know), that the undersigned, who is an individual of limited means, but of unlimited expectations, locates, claims, and intends to hold and work two claims of 200 feet each on this ledge, containing, as he believes and hopes it does, gold, silver, calespar, feldspar and spar the barkeep, besides other precious metals too numerous to mention, together with all the dips, spurs and angles and triangles ranging from vertical to horizontal, and will work the same according to "Hoyle" and the very liberal laws of White Pine District. The undersigned is indneed to make this company of one, as he is anxious that the poor devil who comes along may have a fair show at the extensions, if he can find them. To be known as the Elephant Ledge and Company. William Pitcher, 200 feet; discovery, 200 feet.

Pitcher did not develop the mine, and it slipped away from him.

A GREASY MECHANIC.—The late Colonel Colt was himself a practical mechanic. By his will he left to his nephew an immense fortune. At the time of Col. Colt's death that nephew was learning his trade as a machinist in his uncle's shop, working diligently, in his dirty overalls, day by day, subject to the same rules as other apprentices. On his uncle's death he became a millionaire; but, choosing a guardian to manage his property, he continued at his labor, and faithfully served his apprenticeship. Now, as he walks the rooms of his house, or drives his handsome team, he has the consciousness that if his riches "take to themselves wings and fly away," he is furnished with the means of getting an honest livelihood, and may make a fortune for himself.—*Sci. American.*

THE MOUNT CENIS TUNNEL.—About three-fourths of this work is completed. It is estimated that the whole will be finished as early as the commencement of 1871.

3v18-1m **204 Montgomery street, Room 4.**

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only
GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

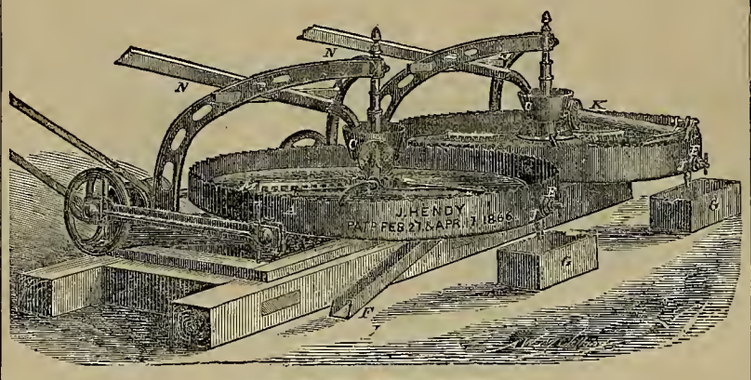
Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-1y

HELIOGRAPHIC
STEEL ENGRAVING AND PRINTING COMPANY.

Steel Engravings produced by an Improved Process at one third the usual rates. Portraits, Country Seats, Illustrated Circulars, Reproductions of Engravings, Designs, etc. E. VON EGLOFFSTEIN, Supt.
3v18-6m16p 133 and 135 West Twenty-fifth st., New York.

PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.
Office at Union Iron Works.

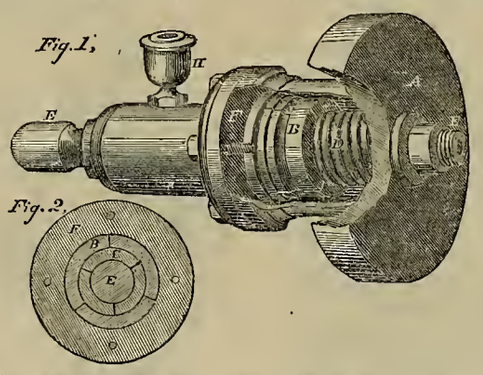
COLLIER & SILLIMAN'S
METALLIC PRESSURE PISTON ROD PACKING.



This invention relates to the packing used to render piston rods or propeller shafts steam and water tight, and has for its object the construction of a metallic packing, which shall be operated upon by gas, the vapor or liquid exerting the pressure, in such a manner as to form a perfectly tight joint. It also consists in so forming the gland of the stuffing box, that it shall serve as a support and guide for the rod and shaft, and at the same time afford great facility for lubrication.

Two small openings now connect the interior of the cage with the source of pressure—as the cylinder in an engine or pump, or the water outside of the ship if it is for a propeller shaft—so that the greater the pressure the closer are the rings forced against the rod and inner face of the gland. In any case the Packing is to be applied to a water or air pump, so that the pressure will come from the liquid or the gaseous substance, as the case may be. One of the most important uses of this Packing is in the stuffing boxes of propeller shafts, in which case the openings connect with the outside water, the pressure on the rings depending upon the depth to which the shaft is submerged. This device is simple, and not easily got out of repair; is perfectly efficacious and self-regulating, and in the case of shafts, especially, will do away with the great expense of repairing the derangements of the stuffing box which now so frequently occur. This new invention has already been adopted on the Central Pacific Railroad and by some of the principal Flouring Mills in San Francisco and Sacramento, and is growing at once into popular favor. A description of the engraving accompanying this will be found in the *Mining and Scientific Press* Jan. 9, 1869, and in the patentees' circular, which can be had free on application.

Certificates of Recommendation:

OFFICE C. P. R. R. CO. OF CAL., Sacramento, Nov. 24, 1868.—*To Whom it may Concern:*—This Company has made a thorough practical test of Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and accordingly recommend it to all others interested.
E. B. CROCKER, Gen. Agent C. P. R. R. Co.

THIS IS TO CERTIFY, that we have been using the Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and would recommend it to all others interested.
SETH H. GARFIELD, Prop. Pioneer Mills, Sac. City; WM. ETCHELLS, Engineer.

For sale at the principal Machine Shops and Foundries in San Francisco. Full particulars can be obtained by addressing ORRIN COLLIER, Sacramento, Cal., or E. B. SILLIMAN, Bridgeport, Ct.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
1v18-3m9p **319** Front street, San Francisco.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 326.—Gold quartz, from Frank Morse, Larrimer's Mill, Grass Valley.

No. 327.—Gold quartz from Yankee Jim ledge, Placer county.

No. 328.—Gold, pyrites and galena in quartz, from the Swezey Pioneer ledge, Newcastle, Placer county. It pays at the mill $15 to $20.

No. 329.—Gold pyrites, Capt. Lee, Grass Valley.

No. 330.—Concentrated sulphurets, from North Star mine, Grass Valley, Mr. Crossman, Superintendent. This mine was sold lately for a million dollars.

No. 331.—Auriferous copper pyrites, from Bald Hill near Auburn, Placer Co.

No. 332—Auriferous copper pyrites, from Green Emigrant mine, Meadow Lake, Nevada county.

No. 333—Graphite, from Alisky & Woodbury's mine, forty miles above Sonora, Tuolumne county. It has the peculiar red glance which always characterizes molybdenum, but which is also occasionally found in graphite. A graphite mine was formerly worked below the Macomber mine, but the quality was not equal to this one, and it was soon abandoned. This is worth $250 to $300 to the ton, according to information derived from dealers in Philadelphia. The method of dressing graphite is, first, stamping fine, and then washing it in a revolving barrel; the water flowing out at one end, carrying with it the gangue. Snow lies for six months in the vicinity of this mine, so that it can be worked for only about four months in the year.

EARTHQUAKE PROOF BUILDING.—Wm. H. Foye, the inventor, recently showed us the model of an earthquake-proof building, of a new design, which is sufficient to convince a practical mind that our people can construct houses, without much extra cost, that will withstand harder shakes than any that have yet been recorded on this coast.

SPECIMENS sent to this city from some of the new coal mines near Argenta, are nothing but bituminous shale.

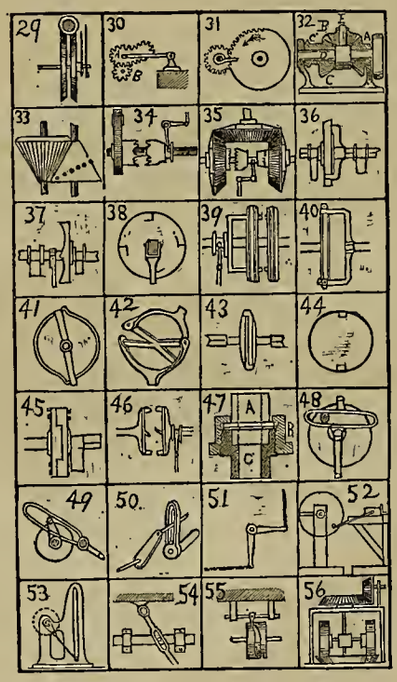
Mechanical Movements.

We continue this week (from page 385, volume XVII) our study of the simple mechanical movements:

29. Numerical registering device. The teeth of the worm shaft gear with a pair of worm-wheels of equal diameter, one having one tooth more than the other. If the first wheel has 100 teeth and the second 101, the points will indicate respectively 101 and 10,100 revolutions.

30. An irregular vibratory motion is given to the arm carrying the wheel A, by the rotation of the pinion B.

31. Intermittent rotary motion of the pinion-shaft, by the continuous rotary motion of the large wheel. The part of the pinion shown next the wheel is cut on the same curve as the plain portion of the circumference, and, therefore, serves as a lock whilst the wheel makes a part of the revolution, and until the pin upon the wheel strikes the guide-piece upon the pinion, when the pinion-shaft commences another revolution.



32. Entwistle's patent gearing. Bevel-gear A, is fixed. B, gearing with A, is fitted to rotate on stud, E, secured to shaft D, and it also gears with bevel-gear, C, loose, on the shaft D. On rotary motion being given to shaft, D, the gear, E, revolves around A, and also rotates upon its own axis, and so acts upon C in two ways, namely, by its rotation on its own axis and by its revolution around A. With three gears of equal size, the gear C makes two revolutions to every one of the shaft D. This velocity of revolution may, however, be varied by changing the relative sizes of the gears. C is represented with an attached drum, C'. This gearing may be used for steering apparatus, driving screw-propeller, etc. By applying power to C, action may be reversed, and a slow motion of D obtained.

33. Uniform into variable rotary motion. The bevel-wheel or pinion to the left has teeth cut through the whole width of its face. Its teeth work with a spirally arranged series of studs on a conical wheel.

34. Clutch-box. The pinion at the top gives a continuous rotary motion to the gear below, to which is attached half the clutch, and both turn loosely on the shaft. When it is desired to give motion to the shaft, the other part of the clutch, which slides upon a key or feather fixed in the shaft, is thrust into gear by the lever.

35. The vertical shaft is made to drive the horizontal one in either direction, as may be desired, by means of the double clutch and bevel-gears. The gears on the horizontal shaft are loose, and are driven in opposite directions by the third gear; the double-clutch slides upon a key or feather fixed on the horizontal shaft, which is made to rotate either to the right or left, according to the side on which it is engaged.

36. Claw coupling.

37, 38. Lever couplings. On the driving shaft, a disk with spurs is mounted, and to the shaft to be driven a lever is hinged. By causing this lever to catch in the spurs of the disk, the coupling is effected.

39. Prong and spur lever coupling.

40. Friction clutch. By tightening or releasing a steel band, encircling a pulley on the shaft, the machinery is thrown in or out of gear.

41. Face view of Fig. 40.

42. Universal joint.

43, 44. Disk couplings, with lugs and cavities.

45. Disk coupling with screw bolts.

46. Self-releasing coupling. Disks with oblique teeth. If the resistance to the driven shaft increases beyond a certain point, the disks separate.

47. Union coupling. A is a pipe with a small flange abutting against the pipe C, with a screwed end; B a nut which holds them together.

48. Crank motion, with the crank-wrist working in a slotted yoke, thereby dispensing with the oscillating connecting-rod or pitman,

49. Quick return crank motion, applicable to shaping machines.

50. The two crank-shafts are parallel in direction, but not in line with each other. The revolution of either will communicate motion to the other with a varying velocity, for the wrist of one crank working in the slot of the other is continually changing its distance from the shaft of the latter.

51. Elbow crank, for changing motion.

52. Crank motion.

53. One stroke of the piston gives a complete revolution to the crank.

54. Rectilinear motion of horizontal bar, by means of vibrating slotted bar hung from the top.

55. Uniform reciprocating rectilinear motion, produced by rotary motion of grooved cams.

56. Pair of edge runners or chasers for crushing or grinding. The axles are connected with vertical shaft, and the wheels or chasers run in an annular pan or trough.

NEVADA SILURIAN FOSSILS, ETC.—Specimens of the fossils referred to in Mr. Clayton's communication, are now on exhibition at this office. They have been referred to by Whitney, and described and named by Meek, in the *American Journal of Sciences;* consisting chiefly of new species of corallines, trilobites, brachiopods (mollusks), and algae or seaweeds. Those who have Dana's Geology, will find an allied species of coralline on p. 263, fig. 435; of a trilobite on p. 189, fig. 245; and of brachiopods on p. 183, fig. 235, and p. 187, fig. 244. Some of the gray and magnesian limestones are almost entirely made up of corallines. In the greenish calcareous slates, trilobites and brachiopods take the lead, constituting the greater portion of the rock.

Mineralogical specimens of interest in the same collection are oolites, (concretionary limestone) of large size, coarsely crystalline in the center, from Silver Peak; tufaceous deposits id.; fluorspar from Last Chance Hill, Aurora, with pseudomorphs of quartz; garnets, from near Carson City; and slags, from the smelting of Partzite with soda ("alkali") for flux at Adobe Meadows, showing the presence of much oxide of copper, and some globules of silver.

NEW PUBLICATIONS.—We have received, from A. Roman & Co., the following holiday books:

Silver Threads, by Harriet B. McKeever.

Comic Recitations and Humorous Dialogues, by Jerome Barton.

Amateur Theatricals and Fairy Tale Dramas, by Miss S. A. Frost.

No Baby in the House, and other stories for children, by Clara G. Doliver. Published by A. Roman & Co., New York.

Also from other sources, the reports of Prof. J. G. Pohlo and Prof. John Torrey, on the Geology of the Dutchess County N. Y. Gold Mining Territory.

The Starling Progressive Papers, by W. D. Reichner, Philadelphia.

The Pacific Coast Almanac and Year Book of Facts, compiled by Henry G. Langley, editor of the State Register, etc.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Account of Famous Mines in Mexico.

BATOPILAS, Chihuahua, Mex., Oct. 24th, 1868.

[Continued from page 34.]

HISTORICAL.

As I stated in the beginning, the district had since about 1812, when the San Antonio mine ceased to pour forth its immense riches, gradually fallen into decay; the mining population removed to other places, leaving finally only a few hundred in the village, disposed to eke out a precarious life by picking and washing over old rubbish piles, or entering the old abandoned mines to pick the remaining metal from the pillars in them. It was only at long intervals that a few enterprising persons then undertook new works, some of which resulted in large profits to them.

Under such circumstances, it happened that in the year 1859, an American gentleman by the name of H. A. Stearns, a man of large experience in mining matters and far-seeing business habits, was induced to visit this deserted district. To him and his untiring energy in its behalf, Batopilas may thank the revival of its ancient glory, now at this date secured beyond a doubt; and his name ought therefore to stand recorded in the annals of this newborn epoch, whose fame I am convinced, will, in a few years hence, shed a world-wide luster over this wonderful place. He at once understood the magnitude of the prospects the district offered, and the necessities it required—capital and labor—and with more than usual energy set to work to make it known.

He succeeded in drawing the attention of certain parties in New York to a splendid claim called the San Miguel. They purchased the same from its Mexican owner, and sent an agent out to open it, Mr. J. Robinson, a gentlemen also of rare business tact, and considerable practical experience, highly respected by everybody, who, after several years' constant working, has succeeded in bringing the claim into such a state that very few anywhere may be compared with it.

THE SAN MIGUEL PROPERTY,

owned by himself, Mr. D. N. Barney, Louis McLane, W. G. Fargo, B. P. Cheney, and others of New York, comprises a number of the most celebrated mines in the district, many of which have given immense bonanzas. Foremost among them rank the San Antonio, discovered and worked about the beginning of the present century, by a comon workman, Cristoval Perez, who sunk down from the surface to the depth of 120 yards in one vast mass of the very richest silver, without once breaking off for fourteen years, and took therefrom more than $16,000,000. A short distance from it the great mine of

EL CARMEN

is seen, which was worked about the same time by the Marquez de Bustamante, who is said to have extracted many millions from it. Among this metal was one lump of solid silver, over 400 pounds in weight. Besides these, the Caucio and the Fierros veins have produced astonishing amounts, none of them being worked deeper than 150 yards. This claim is worked by a tunnel, running into the mountain about forty feet above the river, and destined to cut all the veins and former mines considerably below their bottoms. The tunnel was commenced by the former Mexican owner, Mendazona, and is diligently continued by Mr. Robinson. It has attained, at this date, a length of 1,400 feet, and cut, besides several principal lodes, a great number of lesser, hitherto unknown ones, every one of which was struck in the very richest metal, up to perfectly solid and beautifully white silver. Mr. R. is driving an air-shaft, which, when completed, will allow the better development of the various lodes below. Many millions will then assuredly come out of them within a few years. Only two weeks ago a vein was cut three yards wide in metal, that will give $8,000 to the ton. The company also own a large hacienda with splendid water-power, and a fine house and lot in town.

Next in importance to this claim ranks the great

PASTRANA MINE,

situate on the famed Animas Hill. The lode on which it has been worked to the reputed depth of 150 yards, is looked upon as the most important of all, showing in parts a width of seven yards between its walls, and said to have given in various successive bonanzas, more than $40,000,000. The richness of its metal is known to have been such, that frequently it gave $40,000 in one single week; and a pillar thrown down in later years produced also over $40,000.

Common report says that the principal works in it were abandoned about 150 years ago, in consequence of a tremendous rush of water filling them after a severe rain storm, and that a portion of them, as also the bottom, were left in good ore.

Several attempts have at various times been made to drain the mine, the last and most energetic one by Don Nepomucéno Sanchez, overseer for the Marquez of Bustamante, which was interrupted by the revolution breaking out in 1821, obliging all native Spaniards to fly the country.

It remained deserted until 1854, when an English gentleman, Mr. George Le Brun, induced by certain manuscript documents in his possession, and having full faith in the mine, undertook anew the working on it. He started a tunnel from the east side, which he has ever since continued with the most untiring energy, and never for a day wavering in his confidence of success. In sundry occasional workings in the upper parts, considerable amounts of silver have rewarded his enterprise. He struck a small thread which, beginning not thicker than a knifeblade, within a few yards, gave over $46,000 in massive silver.

Under the most discouraging circumstances this tunnel was driven through exceedingly hard rock, a distance of about 300 yards from the vein, until—I am happy to say—success has at last rewarded his work. A short time ago he tapped the old workings, the water running therefrom for several days in a tremendous stream. When an entrance through the opening was finally effected, what seems to be a pillar, was discovered, whose extent is yet unknown, the metal of which gives about $64 to the carga of 300 pounds, or $450 to the ton, while the rubbish filling the work, averaged $32 to the carga, or $224 to the ton. This fact goes to show that the old reports were at least not entirely unfounded, and verifies the probability of immense riches lying beneath, at the same time being evidence that new developments in these so-called, or formerly abandoned mines, will almost invariably uncover fresh deposits of ore.

The fact of this tunnel having succeeded, will not only serve Mr. Le Brun himself as a well-merited reward, but aid the district immeasurably in its fame.

I will here add, that Mr. Le Brun has always shown the most unselfish kindness to Americans traveling through the country, and deserves their fullest respect for his uniform gentlemanly behavior to them, and for the strictest integrity in all his dealings.

The third claim in importance seems to me to be the one called the

ST. THERESA,

on the Animas Hill. It comprises an unknown number of lodes,—a perfect network of them,—perhaps over one hundred. Those that have been worked, have, wherever touched, all given very rich silver, although the workings on them hardly merit the name of mines, as but very few go over forty yards in depth. The present owner of this claim, a Mexican by the name of Don Jesus Valenzuela, confines his enterprise mainly to one, the Santa Theresa proper, which stands in very rich silver, large masses of pure massive metal coming out of it. The same gentleman owns and works, besides this claim, four other ones on different hills, called respectively, the San Nestor, Animas, St. Domingo, and Aurora, all of which give him very flattering results.

MINERO.

[To be continued.]

WE have ever found that blacksmiths are more or less given to vice. Carpenters, for the most part, speak plainly, but they will chisel when they can get a chance. Not unfrequently they are bores, and often annoy one with their old saws.

IT is reported that the well known stageman, Hill Beachey, has sold his interest in the Golden Chariot mine, at Silver City, Idaho, for $300,000.

[Written for the Mining and Scientific Press.]

Decomposition of Silver Ores with the Aid of Electricity.

EDITORS PRESS:—Adverting to the article in your issue of the 9th inst., upon the use of electricity in the reduction of silver ores, I may perhaps be permitted to make a few remarks. Without arrogating to myself any greater information than that resulting from long and patient study and experiment, I have certainly a right to claim the barren honor of being the first person upon the Pacific slope to apply the electric current to the decomposition of crude silver ores, and the consequent production of first a chloride of, and then metallic silver. The experiments I refer to, commenced as long ago as the year 1859, pending which I filed a caveat in the Patent Office. These experiments were highly satisfactory and successful, but the heavy expense always incidental to new and untried enterprises, compelled me when my means were exhausted, to suspend operations; however, it is without regret that I now find a process of such incalculable value to our mining interests, is at length likely to be introduced. Such information as I possess, it affords me pleasure to supply. The advantages from the electric process over the Patio process are many. By the latter there is a continuous loss of the quicksilver, and this is a very heavy item. The length of time requisite, the much greater labor involved in manipulation of the ingredients, are also very serious drawbacks. Moreover many refractory ores are successfully workable by the electric process, which would not be operated upon by the Patio process. In making this assertion, I am supported by the result of many tests, which I have made in quantities varying from ten pounds to a ton at a time. In the operation of the electrical process the products of the decomposition vary with the nature of the ore, the intensity of the current, and the temperature at which the operations are performed. At a certain stage metallic silver is invariably found in a state of minute division, and susceptible of immediate amalgamation with quicksilver. It is to be observed that the primary production, however, is the chloride of that metal, which is then, by the same current that produced it, reduced to the simple metallic form. The base metals are mostly unacted upon with the exception of lead and perhaps antimony and some few others. By an inexpensive addition, simple in its application, though somewhat complex in its operation, the difficulty is easily obviated. The minor products are hydrogen, sulphureted hydrogen, arsenide of hydrogen, di-chloride of copper, oxychloride of copper, sulphate of soda, sulphuric acid, sulphur, and some metallic chlorides of such base metals as are present, and are acted upon, and the treatment of which I have referred to. Certain points in the process, and in the application of the current, can only be acquired by experience, and like all other chemical manipulations require experimental demonstration in addition to written or oral explanations to render them appreciable by the enquiring mind. The following are the results of some experiments performed by me on sulphide of silver artificially prepared; they may be of some value to those interested on the subject—an excess of chloride of sodium and water being present in each case: 1st. 3 equivaleuts of sulphide of silver, 4 of chloride of copper, and 3 of water were resolved into—3 equivalents of metallic silver, 3 of chlorine, 3 of sulphydric acid and 1 of oxychloride of copper:—$3\,Ag\,S + 4\,Cu\,Cl + 3\,H\,O = 3\,Ag + 3\,Cl + 3\,H\,S + CuCl, 3CuO$. 2d. 2 equivalents of sulphide of silver, 4 of dichloride of copper, and 6 of water were resolved into—2 equivalents of metallic silver, 2 of chlorine, 6 of hydrogen, 2 of oxychloride of copper, and 2 of sulphur: $2AgS + 4Cu^2Cl + 6HO = 2Ag + 2Cl + 6H + 2(CuCl,3CuO) + 2S$. These experiments were performed at a temperature of 60° Fah., and there was formed an excess of oxychloride of copper in them both, produced by the action of the salt water on the positive pole (which was of copper) assisted by the current. 3d. On artificially prepared sulphide of silver at the temperature of 140° Fah., I mixed 4 equivalents of the silver sulphide, 1 of dichloride of copper, with excess of chloride of sodium and water — result 4 equivalents of metallic silver, sulphureted hydrogen was given off, and sulphate of soda, free chlorine, sulphuric acid and sodio-di-chloride of copper found in solution. In this case there was no oxychloride of copper formed, a positive pole of graphite being used. The increase of the temperature greatly facilitates the operation. I may mention that the yield of silver from the ores treated was, in round numbers, from 79 to 98 per cent. of the actual quantity contained in the ore, the greatest being from simple sulphurets and chlorides, and the least from antimonial and bismuthic ores. In conclusion, I would mention that the process is applicable to the reduction of tellurides, selenides, oxides, and all compounds of silver, and upon the authority of the late Mr. D'Aumaile who was associated with me in many of my experiments, that it can be successfully applied to the ore containing the double oxide of manganese and silver, this ore having hitherto been considered too rebellious to be satisfactorily worked by other means.

JOHN SCOTT,
Metallurgical Chemist.

[Written for the Mining and Scientific Press.]

The Silurian Rocks of Southern Nevada.

EDITORS PRESS:—The Silurian rocks of Southern Nevada were first recognized by me in the spring of 1865,—Mr. Stanson, of Austin, and myself made a short visit to Silver Peak district, for the purpose of examining the silver mines of that place. The next morning after our arrival, I discovered "*coralines*" in the gray limestone along the eastern foothills of the Red Mountain range, (near the place where the Silver Peak and Red Mountain mill has since been erected). I then made a search for shaly beds that usually accompany the limestones, and was fortunate enough to find a small point of yellowish slate exposed near the edge of the salt marsh. In this I found numerous fragments of trilobites, but no specimens entire.

Some months afterward I was more fortunate, and got several fair specimens of trilobites and numerous samples of the coralines in a good state of preservation. This collection I gave to Prof. Whitney, to be forwarded to Prof. Meek, of the Smithsonian Institute, for determination. These gentlemen both recognized the fossils as Silurian, but I have not yet received a statement of their classification. In the last two years I have found the same rocks and imbedded fossils twenty-five miles S.E. of Silver Peak, near Alida Valley, in the Gold Mountain district; and I have no doubt they are to be found in numerous localities in the southern and eastern portions of the State.

I herewith send you an ideal section of the country rocks, as they appear in the N. E. slope of the Red Mountain range, on a line from the summit above the gold mines—to the extinct crater—in the valley to the N. E. of that point. The great underlying mass is granite. The gold-bearing quartz veins are in the lower slates near the granite, and usually associated with dikes or beds of dark greenish trap—sometimes above, but generally below the veins forming the foot-wall.

The central portion of the slates carry no rich veins of gold or silver, but in the upper portions near the dolomite, silver is the predominating metal. The dolomite also contains silver-bearing veins in the under portions near the slates. The only metals found in the coraline limestone are traces of copper and silver.

The tertiary sandstones and argillaceous beds are found in *contact with the Silurian*, from which fact I conclude that the Silver Peak region was *above* the ocean level from the Silurian age to the Tertiary period. But in the "Volcano District," about seventy-five miles N. W. of the Peak, the Jurassic, Triasic, and probably the carboniferous rocks are represented. The geology of the great interior Plateau of the continent is a stony *patchwork*, without extended continuity in any one direction.

Yours truly, J. E. CLAYTON.

THE point to which the sea wall has advanced, between Clay and Commercial streets, has from sixty to sixty-five feet depth of mud through which the embankment must settle to find a solid foundation; rendering the preparatory dredging and general progress very slow.

Mechanical.

Electro-Magnetism as a Motive Power.—In 1837, Thomas Davenport, of Brandon, Vt., obtained a patent and came to New York, with a model of his electro-magnetic engine, the working of which astonished the scientific men of that city. It was avowed that he had wrought out the great discovery of the use of electro-magnetism as a motive power. His model was very simple, having two electro-magnets, placed within attractive distances of a revolving steel magnet. A patent was secured in England. The interest of wealthy men was engaged. A large working machine was built, with four of the largest electro-magnets then known, each weighing about 300 pounds. These magnets were charged from a battery of copper and zinc containing a solution of sulphate of copper which, when dissolved, was of the capacity of a barrel. With a cast iron wheel six feet in diameter, weighing 600 pounds, a velocity was attained of seventy-five revolutions per minute.

Professor Wheatstone was loud in his praise of the working of the model. Professor Daniel prophesied that the days of steam were numbered. Professor Faraday saw the wheel revolve for several minutes, and watched with an appearance of astonishment the large electric spark which was given off every time the current was broken, a spark so large that it emitted a light in the evening sufficient to illuminate the room. He spoke not; but taking up a broom, he gently placed the handle of it on the periphery of the wheel, and with a slight pressure the wheel gradually revolved slower. He did not quite stop the motion, yet he saw how easily it could be done. He kindly informed those most interested that his opinion expressed to the public would greatly injure the sale of the patent; so he preferred not to advance one then. The many subsequent failures have proved his sagacity. *Power* is wanting.

We condense the above from an article in the *Scientific American*.

Polishing Wheels for Small Instruments.—A correspondent sends the following to the *Dental Cosmos:*

"Take a piece of sole leather of a suitable size, make a hole through the center and attach it to the lathe in the same manner as a corundum wheel; then with a sharp chisel turn it down to the size desired; coat the face of it with glue, and apply as much coarse emery as the glue can be made to take; put it aside to dry, and you have polishing wheel No. 1. Make another in the same way, only using fleur of emery instead of the coarse, for No. 2. Form a third wheel in the same manner, but instead of the glue and emery, apply crocus with water, for No. 3.

The labor of polishing is diminished by turning little grooves into the face of the wheel before applying the emery.

An excellent wheel for carrying the pumice, in polishing vulcanite, can be formed by fastening together two of these leather wheels with brass screws (common wood screws) between which are three or four thicknesses of woolen cloth cut somewhat larger than the leathers. The leather keeps the wheel stiff and firm, and, as the cloth becomes worn down, will not scratch the plate, even though it should touch it."

Creosote as Fuel.—The London *Mining Journal* of Nov. 28th, has the following:

"An ordinary re-heating furnace of large size is now in constant use at the works of Messrs. Camroux & Co., engineers and boiler manufacturers, at Deptford Creek, in which creosote is the only fuel employed, and its working has given complete satisfaction. Under ordinary circumstances the iron is ready for fashioning in little more than half the time required when coal is used; and, as the heat is equal in every part of the furnace, it is never requisite, as sometimes happens with coal, to replace the metal in the furnace to complete the shaping of it. The creosote is converted into vapor in an auxiliary boiler, and the vapor supplied through a coil of pipe which takes the place of the usual fire; the supply of vapor requisite to produce the desired heat being regulated by a stop-cock, in the same way and as easily as the supply of illuminating gas to an ordinary burner."

The Steam Indicator.—The following is from a paper recently read before the Polytechnic branch of the American Institute, by Charles L. Emery: "The indicator is so constructed and attached that steam from the main cylinder presses upon one side of a small piston in the instrument, the atmospheric pressure being upon the other side. To the indicator piston is attached a spring and a pencil, the latter arranged to mark on paper. The predominating pressure on the indicator piston, whether of the steam or of the atmosphere, extends or compresses the spring in proportion to the intensity of the pressure, and moves the pencil up and down on the paper. The paper is arranged on a drum, which is so connected that it has a side motion corresponding to that of the engine piston. Consequently, as the engine piston moves, the paper is moved sidewise, and, as the pressure changes, the pencil is correspondingly moved up and down; so that the figure or diagram traced on the paper is a combination of the two movements, and should show the pressure at each and all points of the stroke. The mean of a number of ordinates on the diagram represents the mean pressure per square inch of piston, which, multiplied by the area of the piston, gives the total force which produces the piston movement, from which the power may be calculated. The indicator is a beautiful instrument, of great value to the steam engineer; still, in many cases, its indications are unreliable. It shows perfectly whether the valves are adjusted properly; often, when an engine is working improperly, a glance at the diagram will reveal the difficulty, and suggest the remedy. Large leaks in the valves or piston may also be detected in this way. The indicated pressure at the end of the stroke has been employed to determine the quantity of steam used by the engine. Calculations founded on such a basis are entirely worthless. It has been attempted, also, to calculate the friction, from indicator friction diagrams; but the system is practically erroneous. The indicator is chiefly employed, however, to determine the power of an engine, it being supposed that the diagram shows correctly the pressure at all parts of the stroke. Even this it fails to do under certain circumstances. The moving parts of the instrument must have weight and friction, and some force is necessarily required to overcome the latter, and put the mass in motion. If, therefore, the pressure be ascending, the indicator will show less than it should; and when the pressure is descending, the instrument will show more than it ought."

The author goes on to say in the course of the paper, that although the indicator is defective, he is unable to point out another instrument which is fit, in every respect, to take its place.

The Steam Engine Perfect from the Start.—In the course of a lecture recently delivered at Steinway Hall, New York, by Prof. Silliman, he said: "There has never been in the history of inventions since the world began, any machine or apparatus which was so perfect as it left the the hands of the inventor as the steam engine was when it left the hands of Watt. You may stand to-day beside the most stupendous piece of steam engineering in the world, and you will see connected with it no essential change in his invention. It is true that he had no machinery or tools competent to reach the exact results that we can now produce. He had no turning lathes, boring machines, planing machines, but all was done by the cold chisel, the hammer, the file, etc., and the marvel is that he produced such results as he did. I have often thought with what delight that great man would stand upon one of our first-class steam frigates, or by one of our first-class pumping engines, such as is used at the reservoirs in Brooklyn and New York, and see the perfection, the finish, and the smoothness of the work, a result possibly solely due to the genius of Watt, because without that power we could not have had the apparatus with which to apply it."

Liquid Fuel for Locomotives.—The French journal *Moniteur* says that the following plan has been tried at Chalons, for burning petroleum in locomotives: "A stream of the oil flowing from a tap,—which controls and regulates it easily and perfectly,—falls upon a brick slab behind a vertical grating, and is there burned." The *Moniteur* says the experiment was completely successful.

Scientific Miscellany.

Charcoal as a Disinfectant.

The offensive odors arising from the putrefaction of animal remains, are neutralized by powdered charcoal. This is owing partly to the power which the charcoal possesses, of absorption and of concentrating within its pores the noxious effluvia. One volume of it will absorb ninety volumes of ammoniacal gas; of hydrogen gas, it absorbs one and seven-tenths; of oxygen, nine and two-tenths volumes. Some time ago Dr. Stenhouse demonstrated that the absorptive action of charcoal is not a mere passive reception of gases into its pores, but that it exerts a peculiar power in inducing actual combustion of carbonaceous substances, by furnishing the quantity of oxygen necessary to this combustion, which oxygen it had previously absorbed. In other words, charcoal actually possesses the power of burning up organic substances at ordinary temperatures, and of resolving them into their ultimate products. This combustion proceeds moderately, and consumes more time than if the substance had been burned by fire; but the effect is the same, and the same ultimate products are generated in both instances. The fact of the combustion of the noxious gases may be proved by exposing the usual test for ammonia (hydrochloric acid) near the charcoal, when white fumes will arise. The gases which are evolved by putrefaction are mainly composed of carbon, hydrogen and nitrogen, although phosphorus and sulphur are also present, to a limited degree. These gases, passing through the charcoal, in the pores of which oxygen is absorbed, are oxidized and consumed, and the chief products arising from this action are carbonic acid, water and ammonia—the ultimate products of the combustion of animal remains.

Respirators filled with charcoal powder are now worn in hospitals, so contrived as to protect the wearer from noxious exhalations. Filters for atmospheric air, in unwholesome and crowded districts, might be constructed, in which the injurious gases and vapors might be retained and consumed, and only pure air, with a slight admixture of the ultimate products of the combustion of impurities, be allowed to pass. Dwellings may thus be protected from malaria by causing the apertures through which air is admitted to be supplied with charcoal filters. We condense the above from the *Gas Light Journal*.

Mounds in Michigan.—At a meeting of Kent Scientific Institute, Grand Rapids, Michigan, on Sept. 11th, Mr. George W. Smith gave an account of some examinations made of mounds four miles below the city. The group consists of thirteen mounds, which vary in hight from five feet to twenty-five, and in diameter from twelve to sixty feet. Trees of three and four feet in diameter are growing,—and others equally large lie decaying,—upon them. Two vases of pottery, copper and stone implements, bone needles, and a piece of wicker-work, were found. In one mound pieces of flint were seen strewed. The group of mounds occupies an area of 700 by 400 feet. The builders probably were of the same race with those of the mounds further south.

Interesting to the Friends of Science.—F. W. Putnam, of the Peabody Academy of Science, calls upon those disposed to aid the Academy in sending out a collector of specimens to Central and the northern part of South America, for donations. There are no funds of the Institution that can be devoted to that purpose. Mr. J. A. McNiel, an ardent and enthusiastic naturalist, is already in the field, and has just sent home the first installment of specimens, the fruit of his labors since May last. He intends to spend two years upon the matter. On the receipt of specimens at the Academy, they will be arranged at once, and a series selected for the "McNiel collection" of the Academy; the rest will be offered for sale. Any persons who aid the expedition "will receive an equivalent in specimens if desired, as well as the thanks of the Academy."

Meteors and Aerolites.—In the course of some remarks in relation to the meteoric storm of November last, Prof. Wurtz says that whatever might have been the material of which the trains left behind by the meteors were composed,—a point to be determined by the spectroscopists,—it was *solid*, not *gaseous;* and that their light was not that of *incandescence*,—as such could last but a few seconds,—but was that of *phosphorescence*, or else reflected light—probably the former. "What became of this material? We must of course conclude that it settled, or will settle, to become a portion of our solid earth; and further, that the earth is receiving constant accretions in this manner from outer space, since it is rarely that a clear nocturnal sky can be contemplated even for a minute, without witnessing the fiery passage of one of these cosmical 'motes that people the sunbeam,' into our atmosphere. The velocity with which they strike our atmosphere,—twenty-five miles per second, nearly one hundred times the velocity of the swiftest cannon ball,—is sufficient to dissipate them almost instantly into vapor. No chemist will doubt that if a cannon ball can be made to start in motion at anything like this rate, it would instantly kindle and be dissipated as it progressed, in a few seconds, as an elongated cloud of iron-oxide smoke. Occasionally one of these fragments may last long enough to reach the lower and denser atmosphere, and have its motion so retarded that its temperature will fall below the point of combustion or volatilization (it will be *blown out*, so to speak), and reach us as an *aerolite*. Aërolites often show that they have *never been melted*, or even probably red hot, except superficially; a fact which is wholly in accordance with these views, since the whole time of their passage through the atmosphere can be but a few seconds, and there is *not time* for the heat to penetrate into the interior."

American Fossil Botany.—M. Lesquereux says the American continent is "the only part of the world where questions of general significance concerning paleontological distribution can be studied with some chances of satisfactory conclusions." We quote the following from his report:

"The few vegetable remains obtained from the Tertiary of Tennessee and of Mississippi, and from the Cretaceau formation of Nebraska and California, have demonstrated facts which science was scarcely prepared to admit:

"First. That the floras of our ancient formations already had peculiar types, which separated them from each other in the different continents. This is even evident in the vegetation of the coal measures. Therefore, the supposition of a continental union of Europe with America by Atlantides or other intermediate lands, is proved to be untenable.

"Second. That the essential types of the old floras, of the cretaceous and tertiary formations have passed into our present vegetation, or are preserved to our time. The Cretacean of America, for example, has already the Magnolias, which we find still more abundant in our Tertiary. This last formation has furnished a number of species of the genus Magnolia, nearly identical with that now existing in the United States, while the genus is totally absent in the corresponding floras of Europe. More than this; we find in our Tertiary the same predominating types marked on both sides of the Rocky Mountains. On the Atlantic slope, leaves of magnolias, of oaks, of elms, of maples and poplars, and not a trace of coniferous trees; while in California and Vancouver Island, the redwoods or Sequoia, abound in the Cretacean and Tertiary, as now they still form the predominant vegetation of the country."

Preserving Insects.—Dr. S. P. Knox, of Brownsville, Pa., writes to the *American Naturalist*, that after killing his insect with chloroform, he paints it with a solution of carbolic acid in alcohol,—four grains to the ounce,—and then dries it in the sun. It keeps fresh and beautiful. In stuffing animals, he uses cotton soaked in the same solution. He does not even think it necessary to skin them as formerly; but simply removes the contents of the thorax and abdomen.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING DECEMBER 29th.

85,268.—IMPROVEMENT IN BREECH-LOADING FIREARMS.—Salmon Belden and John F. Crabtree, of Visalia, Cal.

1. We claim the double sliding breech block C, with the chamber J, and the opening spring b, the whole constructed and operating substantially as and for the purpose herein described.

2. The lever B′, and the operating pins I and K, on the tumbler D, or an equivalent device for elevating and depressing the breech-block at one motion, substantially as described.

3. The bent spring g, for holding the shell to one side, substantially as herein described.

4. In combination with the barrel A, and magazine B, I claim the double sliding breech block C, the lever B′, with its two operating pins I and K, and the shell extracting spring g, the whole operating as a repeating arm, substantially as described.

In this gun the necessary mechanism for loading and discharging is very much simplified, and the number of motions required are reduced from three or four to ons.

In the construction, a barrel is employed having a receiving chamber or magazine extending along the top of it. The breech block consists of two pieces hinged together, so as to open laterally, and so arranged as to slide up and down by the simple motion of cocking the gun. As the breech block rises by half-cocking the gun, the two sides gradually separate, and by a simple device the discharged shell is kept at one side of the chamber, so that the entrance of a new cartridge will force it out. The entering cartridge is retained by a stop on the other side until the breech block has been returned to its place and the two sides closed, which is done by fully cocking the gun. This brings the cartridge in a line with the barrel, in which position it is fired.

The same mechanism is peculiarly adapted to repeating pistols, and forms at the same time the simplest and strongest arrangement yet discovered, its strength depending on the amount of metal on each side of the breech block.

85,269.—IMPROVEMENT IN EXPANSION WAGON WHEELS.—Salmon Belden, of Visalia, and Johnson P. Ford, of Santa Clara, Cal. (Antedated Dec. 24th, 1868.)

We claim the double clamp E, E, and wedges F, F, for forcing the joints of the felloes together, substantially as described.

The nature of this invention is to provide a wagon wheel so constructed that the felloes can be made to expand against the tire, and avoid the necessity of cutting and upsetting of the tire.

To do this the outer end of ordinary spokes of the wheel is shortened or turned off, and when shortened a bolt or pin is introduced into the end of the spoke, passing up a considerable distance and extending through the felloe in the ordinary way. Nuts are permanently attached to the inner face of the felloes having openings through which the exterior spokes pass. A hollow screw with a band is placed on the extension rods, and when turned up the nuts and felloes are pressed out against the tire, and when turned in an opposite direction the felloes are released from their pressure, admitting of an easy adjustment of the wheel against the tire.

By this construction it is intended that the head of the hollow screw shall rest against the shoulder formed by cutting away the end of the spoke.

85,279.—IMPROVEMENT IN DERRICKS.—Angus Campbell, of Downieville, Cal.

1. I claim the tuck D, consisting of the bow *a*, swinging frames *b*, *c*, and concave rollers *d*, substantially as herein shown and described.

2. The rope G, when arranged as described to brace the boom by being fastened to the truck sliding thereon for the purpose of relieving the topping-lift C, as specified.

3. The hook H, having the nut X, ring *w*, and link *v*, arranged substantially as and for the purpose herein shown and described.

4. The chain O, bar P, lever R, and arm *c′*, in combination with the hook H, nut x, ring *w*, and link i, arranged as described for the purpose specified.

85,371.—IMPROVED QUICKSILVER FURNACE AND CONDENSER.—Thos. W. Dresser, of San José, Cal.

1. I claim the separating walls L, L, in the vapor chamber, with the upper connecting passages M, M, and lower passages N, N, together with the condensing troughs *o*, *o*, the whole constructed and operated substantially as and for the purpose described.

2. The siphon water pipe X, and the pipe b, from the vapor chamber, or equivalent device for withdrawing the vapor by means of a vacuum, and condensing it in its passage, substantially as herein described.

3. The cylinder e, with the buckets g, operating as shown for producing a vacuum and forcing the vapor beneath the water in chamber *d*, and the vapor pipe i, constructed and operated substantially as and for the purpose described.

4. I claim the two flues m and n, with the dampers t, t, t, for regulating the draft, or by closing them entirely to cause a draft through the siphon tube, and the condensing chamber j, substantially as described.

5. I claim constructing the foundation with the inclined impervious plates A, A, and the channels D, between the courses, together with the collecting channels B, substantially as and for the purpose described.

6. I claim a draft as created by the siphon tube X, the endless chain and its buckets g, g, or equivalent device for condensing the vapors and gases which escape from chemical works, for retorting gold and silver amalgams, and for withdrawing and condensing gold that would be lost in melting and refining, substantially as herein described.

The object of this invention is to provide an improved furnace and condenser for the reduction of quicksilver, and other ores of a similar nature, so that the whole operation is conducted with a very small loss of the vapor, which, together with the gases, generated by the heat of the furnace, are drawn and forced through tanks of water, thus effectually condensing all that is capable of it, before the residue is allowed to escape by the flues.

It also relates to an improved method of constructing the foundation, so that the waste which usually occurs by the quicksilver passing through the foundation, is effectually avoided and the whole operation is rendered more economical.

This is effected by constructing a foundation upon which is placed a double inclined plane of iron or other impervious metal, the two planes meeting and forming a trough in the center, by which any escaping quicksilver is carried to a receiver. The planes may be plastered and polished, and used either with or without the iron.

Above this the furnace is finished with a grate for fire, a chamber for the ore, over and through which the heat passes, and a vapor chamber with diaphragms or walls extending across it at intervals. These walls have openings alternately on opposite sides, and a series of troughs between them, through which water is constantly passing.

Above the furnace is placed a tank of water with a siphon tube leading from it to another tank below. A tube leading from the top of the vapor chamber enters this siphon tube, and the water passing down the former, draws and forces the quicksilver vapor into the lower tank in which, and during its passage, it is completely condensed. Still another chamber is so arranged and connected with the lower siphon tank, as to take the water and lead it into an upright tube about one-third of the distance from the top, so that the weight of the water acts on a series of buckets on an endless chain, and forces them down, each carrying with it a portion of vapor drawn from the principal chamber, and condensing it, thus doing about double the work that the siphon would do alone. The escape flues have a series of valves or dampers for stopping or changing the direction of the escaping gases, while a final condenser is constructed at the base of the chimney.

85,398.—COVER FOR POTS, KETTLES, ETC.—Geo. Reuben, of San Francisco, Cal.

I claim a cover for cooking and other vessels having the opening C, covered with wire gauge or perforated tin surmounted by the flange D, the whole surmounted by the cover E, locking into the angular slots *c*, *c*, arranged substantially as herein described.

This cover is so constructed that the steam may be permitted to escape without danger of any foreign substance falling into the vessel. It is also a great convenience in pouring off water from the vegetables being cooked, as by merely taking up the vessel with the hands and turning it upside down, the water may be turned off without breaking or injuring the vegetables, and it consists in making a hole in the top of the cover which is covered with wire gauze or perforated tin. A flange is made around this opening, over which a small cover is placed and secured by means of pins on the inside of the rim which lock into angular slots in the flange. The upper cover can be removed and the steam allowed to escape from the cooking vegetables, or it can be allowed to remain and thus present the same appearance as an ordinary cover. The inventor is an ex-printer, and a well-known genius.

85,402.—IMPROVED SHACKLE AND SUPPORTER.—Wm. Riley, of Salem, Oregon, assignor to H. Carpenter, of same place

1. I claim the improved shackle A, B, with the tongue G, and mode of fastening upon the ankle, substantially as herein described.

2. The supporter E, and the mode of fastening the sams to the shoe by means of the *strap* I, and heel plate J, constructed and arranged substantially as herein set forth.

3. The mode of preventing the shackle from turning on the ankle by means of the stops L, L, as specified.

85,409.—IMPROVEMENT IN RAILROAD TICKETS AND PUNCH FOR CUTTING COUPONS THEREFROM.—Henry M. Stow, of San Francisco, Cal.

1. I claim a ponch ticket adapted to contain change with a coupon printed thereon or attached thereto, substantially as and for the purpose set forth.

2. In combination with an instrument for securing coupons and automatically depositing them in a box or other receptacle, substantially as described, I claim a needle so located in the box or other receptacle that it will perforate and retain upon it each coupon as it is deposited, and which, on being withdrawn, will draw a thread through all the said coupons, as set forth.

3. In combination with an instrument for severing coupons and automatically depositing them in a box or other receptacle, substantially as described. I claim a sliding cover to such box or other receptacle, which will automatically slide over the box or other receptacle, and close it when the jaws of the instrument open and receive from said box when the jaws close, the same being operated substantially as herein described.

4. In combination with an instrument for severing coupons from tickets, substantially as described, I claim a needle so located in relation to the cutting head or other equivalent cutting device, that it will pierce and retain upon it each coupon as it is cut off, and so constructed and arranged that by withdrawing it from said coupons it will draw a thread through all of them, substantially as and for the purpose specified.

5. In combination with the cutting head and retaining box herein described, I claim the case or shield D, substantially as and for the purpose set forth.

85,474.—IMPROVEMENT IN FARM GATES.—Albert J. Potter, of Omaha, Nebraska.

I claim the gate A, bolt *h*, lever F, bevel wheel D, cogged segment D′, shaft *d*, cylindrical bar C, lever E, cords *e*, *f*, *g*, and posts B, B, B, B, all combined, constructed, arranged and operated, substantially as and for the purpose set forth.

RE-ISSUES.

3,244.—IMPROVEMENT IN GANG PLOWS.—Robert Baxter, of French Camp, Cal. Patented Aug. 6th, 1867.

I claim a standard for the support of the mold-board, or other like parts of a plow formed in one piece with a projecting head for the attachment of the beam, substantially as described.

FOR THE WEEK ENDING JANUARY 5th.

85,578.—IMPROVEMENT IN HORSE-POWER Charles F. Gay, Albany, Oregon.:

1. I claim the combination of the pivoted circular platform D, wheels F, and spirally-flanged cylinders or drums C, with each other, and with the platform A, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the band I, and band pulleys H, with the cylinders C, substantially as herein shown and described and for the purpose set forth.

3. The combination of the hand wheel K, with one of the flanged cylinders C, substantially as herein shown and described and for the purpose set forth.

4. The combination of the gear wheel L, gear or pinion wheel M, shaft N, and band wheel O, with one of the flanged cylinders C, substantially as herein shown and described and for the purpose set forth.

5. The combination of the gnide pulleys R, and pulley box Q, with the driving hand P, substantially as herein shown and described and for the purpose set forth.

85,588. — IMPROVED BOTTLE STOPPER.—John T. Haviland, San Francisco, Cal.:

I claim a top for bottle-stoppers, consisting of the tapering holding-ring B, and the screw-cap C, the whole connected and arranged substantially as and for the purpose described.

85,606.—IMPROVEMENT IN PACKING FOR STEAM ENGINE PISTON RODS.—David Neahr, Fort Yuma, Cal.:

I claim the construction and arrangement of the series of rings D, E, box G, spring C, and follower F, substantially as shown and described.

85,621.—IMPROVEMENT IN GANG PLOWS.—Z. T. Sweet, Eugene City, Oregon.:

1. I claim the combination of the cam spring H, rock shaft I, foot piece j, and staple *h*, with the side bars *a*, *a*, block *h*, catch *i*, and beams G, all arranged and operating as described for the purpose specified.

2. The arrangement of the rack *d*, and the angular lever D, with the slotted guide plate d, upon the axle and the slide c, upon the arm b, of the wheel B, whereby the weight of the cultivator holds the lever locked in any desired position, as herein shown and described.

85,623. — IMPROVED COMPOSITION TO BE USED IN THE MANUFACTURE OF SOAP.—Richard P. Thomas, San Francisco, Cal.:

I claim utilizing resinous substances and rendering them soluble in water by combining them with the substance, and in the proportions herein described.

85,676.—IMPROVEMENT IN SHINGLE MACHINES.—Isaac I. Lancaster, Vancouver, Washington Territory.:

1. I claim the guide plates M, M, constructed with straight and oblique grooves m, m, and employed in combination with the riving-knives J, J, substantially as and for the purpose set forth.

2. The pair of reciprocating knives J, J, and the feeding mechanism R, S, U, V, operated by the return stroke of one of the said knives, all substantially as and for the purposes herein set forth.

The following was issued Dec. 15th, 1868, but was inadvertently omitted in the Commissioner's report to us:

84,860.—HAIR CUTTING SHEARS.—Lee D. Craig, Nevada City, Cal.:

In combination with the blades *A* and *B*, the comb *F*, adjusting plate *E*, set-screw *D*, and lug *C*, the whole forming a hair cutting shears, substantially as described.

This invention is to provide an improved attachment for shears to be used for hair cutting. The improvement consists of a sliding slotted plate, which may be moved up and down in a plane at right angles with that in which the blades of the shears move, and held at any point by a set screw. Below the blades this plate is bent at right angles and has a short comb fastened to it, so that the comb is parallel with the blades, and hold it till it can be cut. It also regulates the length, which is determined by the point at which it is set.

THE attention of mechanics and others is called to the card of Messrs. Noble & Fleming, who have opened machine works at No. 10 Stevenson street. They pay particular attention to repairing engines as well as all kinds of wood working machinery. They are agents of the Davis wood planer and dove-tailing machines, together with a variety of other tools, indispensable to the mechanic.

THE OHIO EXCAVATOR AND DITCHER, of which a number are being made for Capt. Burns at Casebolt's carriage factory, and which was worked at the late State Fair, is now in use on the Western Pacific Railroad, and said to be giving satisfaction. It is a large scoop mounted on two wheels, and adjustable as to the depth of the ditch to be made; behind it is a belt arrangement, by which the earth is carried back as soon as brought up by the scoop, and deposited in a cart having a bottom which drops out when the dirt is to be dumped. The advantage is that a full load of dirt is carried away on wheels at once, and may be deposited at any place desired,—obviating the frequent trips, great friction, and small loads in the use of the scraper. The price of the excavator is $450.

Weekly Stock Circular.

By Associated Brokers of the S F Stock and Exchange Board.

SAN FRANCISCO, January 23, 1869.

City Stocks.

We note the following transactions in other than mining shares: A large amount of Spring Valley Water stock, at $566@66 75 per share; San Francisco Gas, at $80 @82; Oakland Railroad, at $52.

In addition to our previously announced dividends of the Savings and Loan Societies of this city, we add that of the French, which disburses 11 per cent. per annum, net, to its depositors.

From the Annual Statement of the Pacific Insurance Company, of this city, made on the 1st inst., we take the following:

Capital stock (gold)	$1,000,000 00
Amount in excess of capital, available to pay losses and dividends	529,540 18
LIABILITIES.	
Losses in process of adjustment	43,832 84
Amount required to re-insure outstanding business, being 50 per cent. of unexpired Fire Premiums and all Marine Premiums	279,628 77
Total	$328,461 61
DISBURSEMENTS.	
Amount paid for Fire losses	$203,248 25
Amount paid for Marine losses	148,892 48
Dividends paid stockholders	60,000 00
Paid for commission to agents	50,617 55
Salaries of officers, attorneys and employees	49,184 18
State and Federal taxes paid	40,236 05
Amount of all other payments and expenditures	101,453 32
Total	$653,631 83
Net amount of Fire risks written during the year	$40,452,740 00
Net amount of Marine risks written during the year	20,788,181 00
Amount of Fire risks in force Dec. 31, 1868	33,372,804 00
Amount of Marine risks in force Dec. 31, 1868	2,865,866 00

Deducting the losses in process of adjustment, together with the amount required to re-insure the whole outstanding business of this company, the same being calculated at the rate of 50 per cent. on all unexpired premiums, which the above statement shows as liabilities, would leave a net balance of $201,278 57.

The statement of the California Insurance Company for the year ending December 31, 1868, shows assets amounting to $309,296, including $200,000 capital; liabilities, including amount required to re-insurance outstanding risks, $70,126. The receipts of the company for 1868 were $165,259, of which $115,271 was for premiums. The expenditures were $150,703, including $76,895 for losses and $48,000 for dividends to stockholders. The amount of losses for the year, including those reported and disputed was $68,924. The net amount of marine risks written was $4,186,437, while the amount outstanding on the 31st December was $1,178,583, on which the premiums were $75,873.

From the annual statement of the Merchants' Mutual Marine Insurance Company, we learn that their paid up capital is $500,000; surplus above capital, $182,186, making total assets of $682,186. The amount of liabilities on the 31st of December, 1868, not including amount required for re-insurance of outstanding risks, was $44,658; amount of outstanding risks at the close of 1868, $3,134,583.

Mining Share Market.

In regard to mining share transactions, we may state that the market has been quite variable, but the present condition of the Comstock Lode, if anything, looks more hopeful, most developments tending to a better state of things in the course of a few months. We might reiterate here what we stated in our last issue regarding the construction of a railroad from Virginia City to the Truckee River, which has already received the pledged aid of a number of the most prominent companies, for the purpose of enabling the reduction of the low class ores, which are now unavailable. This project has already improved the several stocks, and its completion will undoubtedly advance them to a marked extent.

The report of the Amador Mining Company for fifteen months, ending January 1, 1869, is before us, and from it we make the following extracts: From 30,794 tons of ore reduced during the period under review, $658,378 70 in bullion was obtained, showing an average yield of $21 50 per ton.

RECEIPTS.

The total receipts from October, 1867, to January 1, 1869, aggregate	$679,651 45

DISBURSEMENTS.

Dividends, No. 1 to No. 16	$340,400 00
Mine	168,512 16
Eureka Mill	52 111 22
Badger Mill	15,479 51
Rose Mill	7,185 45
Construction account	26,942 03
Real estate	26,000 00
General expenses and salaries	8,736 14
Office expense	4,058 88
Sundries	12,744 35
Bills receivable	5,800 00
Cash on hand January 1, 1869	11,681 59
	$679,651 45

The assets are stated at $98,129 98. The total mining expenses have been $4 67 per ton, and for milling, $2 30 1-10, making an aggregate of $6 97 1-10 per ton. The President, in his report, says that, "Somewhat less than a year since, this mine was examined and reported upon by eminent engineers, who estimated the reserves then in sight at 108,000 tons, possessing, in place, a net value of $850,000. Since that report, there have been extracted and reduced 21,700 tons, yielding $464,250 gross." A dividend of $6 per share will be paid on and after the 20th instant. The receipts of bullion to date on January account foot up $23,000. The Badger drift is in some twelve feet, showing a vein from twenty inches to two feet thick, and is looking fine. It is believed the rock will go $100 to the foot.

Hale & Norcross was in good request early in the week at an advance, but at the close shows a very material recession. On the 18th inst. the south breast was about five feet wide at the top and six feet at the bottom. Assays of this ore went from $40 to $52. Later news shows these developments to be less promising. In the north cross-cut they have made thirty feet without reaching ore, and have not yet reached any cast clay. On the third station a tunnel is being constructed to the main tunnel, in order to reach the point where the ore is found. The drift is nearly completed, and they will soon be ready to sink a winze.

Kentuck has received bullion to the amount of $34,112 on January account; and Crown Point $9,491....Eureka (Cal.) paid a dividend of $5 per share on the 20th, and Amador (Cal.) $6 per share on the same day.

Chollar-Potosi, for the week ending Jan. 15th, shows an ore yield of 600 tons. At the 1,100 level drift water came in at the face of the drift on the 11th instant, but has since decreased, and is said to flow from porphyry alone. At the 920 level thirty feet had been made, through a mixture of clay and porphyry, the seams of which are horizontal, or nearly so.

Golden Chariot (Idaho) is one of the recent stocks brought into the market. The location consists of 750 feet. The stock is divided into 10,000 shares. A dividend of $2 50 per share was paid on the 20th inst. From 293 tons of ore they obtained $55,000, giving nearly $200 to the ton. They had a surplus of $31,099, after paying expenses in December, and deducting the dividend, have $6,000 on hand.

Overman received $3,441 87 in bullion on the 17th, and $2,481 72 on the 19th....The 1,000 level of the Empire has been opened and a drift run some four feet....Daney levied an assessment of $2 per share on the 9th....Ophir is destined to be an active stock so soon as drifting will be commenced from the lower levels. The 700 level will be reached, it is thought, within a month, and then drifts will be simultaneously started from the 600 and 700 levels....Belcher shows a rapid rise. The office is now located in this city, with the Secretary of the Kentuck Company. The stock, on its new basis—ten shares for one formerly issued—is quotable at the close at $18@20 per share.

We call the attention of the reader to the annexed table, the same being a monthly statement relative to most of the stocks dealt in at the Board, showing the highest and lowest prices monthly of the last quarter of 1868, of twenty-three companies, together with the bullion yield, assessments levied and dividends disbursed during the same time, giving also totals of 1867 and 1866. With the exception of the Yellow Jacket Company, it is very complete. That company, during the fiscal year ending June 30th, produced $680,000 in bullion, of which no account is given in our table, for the reason that we have been unable to obtain the monthly yield from time to time. Taking the above amount as a basis, we find a bullion product for said company of about $60,000 per month.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

METROPLITAN M. & M. Co.—White Pine, Nev. Jan. 15th. Trustees: Alpheus Bull, E. Hindman, J. C. Collins, Peter Johnsod and Geo. W. Clark.

DIAMOND SILVER MINING Co.—Lander County, Nev. Jan. 15th. Capital stock, $1,400,000; 14,000 shares, $100 each. Trustees: John Bamber, Isham Case, D. D. Cook, J. R. White and F. H. Wells.

BISMARCK MINING Co.—White Pine, Nev. Jan. 18th. Capital stock, $200,000; 2,000 shares, $100 each. Trustees: John F. Taylor, W. H. Sears, John Nightingale, R. P. Franklin and James T. Godfrey.

VIRGINIA No. 2 MINING Co.—White Pine, Nev. Jan. 18th. Capital stock, $80,000; 8,000 shares, $100 each. Trustees: P. Clough, Eugene B. Drake, John F. Mitchell, John W. Coleman and J. C. Steinbergan.

WHITE PINE SMELTING Co.—White Pine, Nev. Jan. 19th. Capital stock, $50,000; 1,000 shares, $50 each. Trnstees: George Cofran, D. D. Shattuck and W. P. C. Stebbins.

WHITE PINE MUTUAL M. & M. Co.—White Pine, Nev. Jan. 19th. Capital stock, $1,000,-000. 10,000 shares, $100 each. Trustees: A. W. Blair, Dr. John Grant, O. P. Sutton, John Nightingale, J. E. De la Montagnie, John A. Stanley and F. G. Smith.

WHITE PINE WATER Co.—White Pine, Nev. Jan. 21st. Capital stock, $1,000,-000; 1,000 shares, $1,000 each. Trustees: A. W. Von Schmidt, Thos. Bell, W. C. Ralston and Alvinza Hayward.

DOLOMITE CONSOLIDATED MINING Co.—White Pine, Nev. Jan. 21st. Capital stock, $500,000; 500 shares, $100 each. Trustees: Joseph Osborne, C. E. Barry, E. W. Leonard, J. L. Howard and J. C. Spencer.

ELECTION OF OFFICERS.—SAN FRANCISCO GAS Co.—Jan. 18th. Directors, J. A. Donohoe, John Parrott, C. E. McLane, J. D. Walker and J. G. Eastland; President, J. A. Donahoe; Secretary, Joseph G. Eastland.

A GRECIAN BENDER ON THE RAMPAGE.—A few days since one of our fashionable belles sauntered into one of our city drug stores, and inquired of the young man in attendance if they had Magnolia Water. Upon being answered in the affirmative, she said she would take a bottle. Whereupon the young man proceeded to do up the package, but was interrupted by the young lady remarking that if what he was doing up was for her, he had made a mistake; that it was not PLANTATION BITTERS, but Magnolia Water, which she inquired for. He excused the mistake by telling her that she appeared to have the "Grecian Bend," or *colic stoop*, very bad, and knowing that Plantation Bitters were highly recommended, supposed that was what she wanted. Whereupon she grew wrathy, and retorted that he was a sickly, bilious Pill, and by all means to take it himself, it would do him a power of good. She procured the Magnolia Water, and left the store highly indignant. *

THE VELOCIPEDE, we understand, has made its appearance, as might have been expected, at Woodward's Gardens. There is nothing new or old, strange or wonderful, in the animal, vegetable or mineral kingdoms, that cannot be found either in the cabinet or on the grounds. *

IF the type of your evening paper begins to look small, dim and indistinct, you will find a remedy by applying to C. MULLER, 205 Montgomery street. You will obtain a pair of spectacles adapted to your eyes. *

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Chronicle, Jan. 9th: At a distance of 100 ft. from the mouth of the tunnel and 65 ft. from the surface, the Michigan Tunnel Co. have this week struck some good looking ore which resemble the Tarshish ore.

The report of the several officers of the Mountain Tunnel Co. shows that the tunnel is in close proximity to the ledge, which is liable to be struck any moment. A large number of companies having claims on the ledge will start work as soon as the Mountain Co. get into paying ore.

AMADOR COUNTY.

Jackson *Ledger*, Jan. 16th: There is now at the mill of the Amador Co. 2,000 tons of quartz, and there is also 500 tons on the two dumps. The company are running 72 stamps day and night, but with this capacity for crushing they are not able to keep up with the yield of rock from the mine.

A fine quartz mill is being fitted up at Tibbit's foundry, to be used in crushing rock taken from the Anaconda mine at Pine Grove.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, Jan. 16th: A fifth interest in Chapman, Hopper & Co's quartz lead, located near Railroad Flat, has recently been sold for $3,000.

The Lower Rich Gulch correspondent writes: Mining has again been started and work resumed on most of the claims here, with a renewed vigor. At the Palomo mine they are not taking ont ore at present, but are engaged in connecting their north and south levels, in order to drain the water to their south shaft. The next mine adjoining the Palomo, is Alexander & Co's. They have a 10-stamp mill running night and day, pounding out the precious metal. They are now working from their lower level, 100 ft. below their former one, and are getting better ore than they ever have had since they opened the mine....The Norton claim has been recently purchased by Mr. Smith, of Grass Valley, and work has been again commenced with good prospects of striking the vein. Should they be successful in getting a vein there, a first class mill will immediately go up. From present appearances, Rich Gulch has as good a prospect in the future as any mining locality in Calaveras County.

MARIPOSA COUNTY.

Mail, Jan. 15th: Hambleton's quartz mill, situated near Bridgeport, has been crushing rock for several weeks past. No clean up has yet been made.

NEVADA COUNTY.

Transcript, Jan. 14th: The American mining claim at Sebastopol, has for several years been one of the leading gravel claims of the county. The yield has been regular and the amount about the same at each clean up. The last two runs made have yielded as well as the preceding ones; the first being $12,000 and the last $14,000.

The mining prospects at Columbia Hill are exceedingly encouraging. The mining companies are preparing for work, and the mines have, many of them, passed into the hands of capitalists, who are able to open the ground at a lower grade than has yet been worked. The Union Gravel Co. are employing a large number of men, and will open their claims to a great depth. The Columbia Hill basin has yielded a large amount of money, and the bedrock has never yet been reached. Of late years men of capital have become interested, and the mines will be opened to a greater depth, and made to yield larger than heretofore. The French Co. has extended its ditch to the Hill, and the prospect is that the water rates will very soon be reduced.

One-half interest in the Hawes & Co's claims at Rough and Ready, has been purchased by a Mr. Gibbon.

Mining in the immediate vicinity of San Juan has not been very lively for a year or two past, but there is now a prospect for the resumption of work on San Juan Hill. County Surveyor Bradley is engaged in making a survey for a tunnel for the Empire Mining Co., on the Hill, and it is thought work will soon be commenced.

Jan. 17th: Nevada district has several mines which bid fair to make for it a reputation among quartz mining localities. The Banner Co. will soon start up their new 40-stamp mill, and during the next season they will have abundance of rock to keep them constantly employed. The New York Co. has resumed operations on the old Sneath & Clay mine. The Pittsburg has recently started up new hoisting works, and is now better prepared for work than ever before. Besides these old established mines there are a number which are being prospected, several of which promise to yield largely.

Gazette, Jan. 12th: The IXL Co. at Moore's Flat, cleaned up last Saturday over $4,000. The company have been obliged to suspend operations for the winter, on account of the heavy storm.

A blast of 100 kegs of powder will be set off in the Manzanita claims of Maltman & Marselus, some time this week. A tunnel has been run 65 feet into the bank, which at that place is 70 feet in hight, and from the head of the tunnel there is a cross drift 60 feet in length. The powder will be placed in the cross drift, the tunnel filled with gravel, when the blast will be set off.

The Willow Valley mine is promising well. Twenty tons of rock crushed last week at the Oriental mill, yielded $55 per ton.

Haroun & Co. have struck rich gravel on the Rocky Bar claims, half a mile above Washington. The claims of Battis & Co., which were flooded two weeks ago, have been pumped out, and work is again resumed with a full complement of hands.

Grass Valley *National*, Jan. 13th: The mill of the Empire Co. at French Corral is now doing a good business; while the Nebraska claims, owned by Ponlinier & Coleman, have been paying largely. The latter company have recently put in a submerged pump to free their claims of water, which is found to work admirably. The cement is composed of a gray sand, in which one would hardly expect to find gold, but it yields large returns.

Jan. 16th: We are informed by O. Sweeny, that he has sold 500 feet of the Grass Valley ledge for $3,000 cash.

Grass Valley *Union*, Jan. 14th: The Seven-Thirty Mining Co. have been in a lawsuit for some time past, and now that they have gained it, will go ahead to take out rock which will pay them as well as did their first crushing. Then they made something over $1,000 per day for all the company.

Jan. 15th: There has been no falling off in this district during the past week, either in the number of mines being worked, or in the average yield of pay. The Empire, of Ophir Hill, has backs enough to go on for three or four years. The Empire will surely pay large dividends from this time forward. The Idaho and the Eureka are keeping up their average pay, or perhaps going a little ahead of their average. In the northern part of the country, hydraulic mining is active, and the pay promises to be large. In this immediate vicinity the placer mines have not been worked as yet this winter, to any extent.

Gazette, Jan. 19th: Fogarty and Fitzsimmons lately purchased a body of cement claims, situated near the South Yuba, below Jones' Bar, for which they paid $4,000. They took out several tons of the cement, and worked it by mill process, and the yield largely exceeded their expectation. The claims are extensive, containing 3,000 feet along the deposit, and in view of the rich yield of the cement, are now considered very valuable. The owners purpose erecting a mill at once to work the claims.

Grass Valley *Union*, Jan. 19th: Yesterday we happened to be in Fiddley's bank, when J. C. Coleman, of the Idaho came in, bearing an iron bucket of yellow metal. The little dab only weighed 345 ounces. It was the result of a week's run.

PLACER COUNTY.

Truckee *Tribune*, Jan. 16th: The Dutch Flat correspondent writes: The Baker Bros' new cement mill has been running for eight or ten days with indications of a good yield. They will have a clean up tomorrow.

The miners of this vicinity now have plenty of water once more, and are as busy as bees in their claims, many of which will continue to yield good dividends to their owners for many years yet to come.

PLUMAS COUNTY.

La Porte *Union*, Jan. 9th: Turner, Rice & Co., the owners of the Black Hawk claims near Quincy, have pocketed the sum of $15,000, for the last summer's work.

The quartz mill at Argentine, owned by Duesler, Knisely & Co., has suspended for the present, but will resume work again in a short time. An interest in this property was purchased by Mr. Duesler a short time since for $750.

The North Fork correspondent writes: In consequence of high water there has been less river mining done on the North Fork this year than any year previous; however, there are a number of bank and bar claims that are paying well.

At Carriboo, Nissen, Shoeffer & Jones are making $4 per day to the man in their bank claims, and have any amount of ground that prospects the same per day.

The rich claim of Joseph Hickman still continues to pay immensely. His has been and is the best claim ever struck in this vicinity. Thos. Orton, in the adjoining claim below, and Mr. Drake, in the adjoining claim above, are doing well.

At Bamboo Bar, Balliett & Co. are making about $10 a day to the man.

Boston & Bryan are engaged in cutting a race through the bar which will drain about 700 feet of the bed of the river.

At Dutch Hill, Riddle, Catlania & Baptist, in the old Dutch Hill claim, are making $4 per day to the man.

In consequence of the caving of some of the old works in the Zearing claim, the prospectors, Waggoner & Ferguson, are now running a new tunnel.

At Barker Hill, things are looking up. Last spring most of the miners left this place, thinking the mines "no good," or worked out. A few remained, and these few are now receiving pay for their perseverance. J. J. Mechlin is making as high as $20 per day to the man. Bly & Stanley have good prospects.

SISKIYOU COUNTY.

Yreka *Union*, Jan. 9th: A Scott's Valley correspondent writes: John Carroll & Co. are taking out lots of money from their claims on McAdam's Creek.

Until the storms of last week there had been no rise in the streams to interrupt river mining. Claims in the Scott River and the Klamath continued to be worked on up till the storm of last Saturday. Scott River raised so as to drive miners out of the river claims; and on the Klamath, miners became alarmed and took out their wheels, though the river has not risen sufficiently to interfere with their workings had they left them in. The fall and winter have been remarkably favorable for river mining. The rain which fell last Saturday, while it has put a stop pretty much to mining in the beds of the rivers this winter, has furnished water in the gulches so that the vigor with which gulch mining will be prosecuted for some time will more than make up for the loss sustained by the stoppage of the other.

TRINITY COUNTY.

Weaverville *Journal*, Jan. 15th: Orson Fox is putting up a hydraulic for the purpose of opening a new claim on Five Cent Gulch. Considerable fine gold is found in the surface, and a tunnel, run about ten years ago, established the existence of a channel in the hill having a regular deposit of good-looking washed gravel. Should he find good pay it will be the means of opening a number of claims in that vicinity hitherto untouched.

A correspondent writes from Lewiston that John Arn has purchased the old Crow ditch, and allows the ground upon which it is located to be mined out, furnishing water from his Rush Creek ditch. There is good pay extending from the front to the Crow ditch, and probably some distance back of it, that will afford employment to several companies for a long time.

ARIZONA.

Prescott *Miner*, Dec. 19th: From parties who visited the Sterling this week, we learn that matters were progressing favorably there. The mill was crushing the ore, and the chlorination works were in full blast. Six tons of sulphurets or pyrites, were roasted this week, and on Thursday last, they were being operated upon in the vats. It is thought $1,000 will be realized from the batch.

Capt. Shoupe sold, recently, to Jackson, Lovejoy & Co., a one-sixth interest in the Excelsior diggings, on Lynx Creek, for $2,000.

A party of placer miners left for Big Bug early in the week.

Geo. Monroe, who arrived here recently from Wickenburg, gives a glowing description of the Vulture mine at that place. He says it is now producing richer rock than he ever saw in California, and plenty of it.

Dec. 26th: The Sterling mill is idle, and will remain so until after the holidays.

Good rock continues to be taken out of the Plantauea mine.

The Chase ledge is widening, and rock getting richer.

Denver *Herald*, Dec. 25th: A correspondent of this paper, writing from Santa Fe, gives the following: Eighty miles southwest of Tucson is the Cababi mining district, said to be very rich in silver. But the great El Dorado of Arizona, at present, is at Apache Pass, or around Camp Bowie, 110 miles this side of Tucson. Col. Stone showed us some specimens of white quartz completely gemmed, studded and streaked with free gold, in the ratio of about an ounce of gold to five ozs. of rock. Those new mines are now being developed by about 100 persons, principally from Pinos Altos and Tucson. The lodes are chiefly decomposed quartz, even down to a depth of 40 ft. The principal paying lodes that have been opened to a depth of 40 or 50 ft. are the Montana and Harris.

COLORADO.

Central City *Herald*, Dec. 26th: We saw a silver brick at Stewart's smelting works, Georgetown, weighing 342 ozs., valued at $1.22 per oz—$417.24....A large stream of water has been struck in the Quartz Hill tunnel.

The ore in the Briggs mine is rapidly improving, and Mr. Beach thinks in a few days he will strike a large body of peacock ore.

Mining is taking a start on Bates Hill, Mountain City. The Gaston Mining Co. are working the original lead of that name. Taylor, Hammond & Stevens are sinking a shaft on the same lead. Ed. Moore has recently taken a lease from Turney, and is working at the junction of the Hope and Gaston.

We saw a splendid specimen of ore from the Franklin lode, this morning. It was of a bright blue color, and literally covered with native silver.

The Conqueror lode, on Leavenworth Mountain, Clear Creek County, is proving to be a first class piece of property. The walls are good and about four feet apart. The ore is composed of sulphurets and galena mixed, and is about six inches wide. Select specimens assayed, shows it to be very rich, and 1½ tons is now at the mill of Huependen, Wolters & Co. for treatment.

Central City *Register*, Dec. 31st: Wells, Fargo & Co's express took down yesterday morning $14,000 in gold, and 200 lbs. of silver bullion.

A. S. Wright came up from Boulder last night, with another installment of 288 ozs. of bullion from the Hoosier mine.

Robert Teats brought up a beautiful bar of silver bullion last night, weighing 487 ozs. This is about the average daily product of his mill, running on ores from his own mines on the Cooley and Gilpin County lodes, which are producing more ore than ever before. These lodes were discovered in June last, since which time they have produced upwards of 20,000 ozs. of silver. The largest assay that has been obtained from crushed ore in bulk, from this mine, is 735 ozs. per ton, and the highest from selected specimens is a little above 20,000 ounces.

Bar mining about Idaho is rather dull at present, owing to the cold weather, yet a few parties keep pegging away, and are generally making good wages. Maj. Cannon and brother are working the old Spanish claim, on Spanish Bar with good results. Schwartz and Mixer are doing a good business on Illinois Bar. Reeder & Co. are still working on Bull Bar, which is paying very well. Wright, Clenfield & Co's claim is being worked, and is paying well. John M. Dumont has got work started on both the Garden and City tunnels, in the former of which he has some fine looking ore.

Georgetown *Miner*, Dec. 31st: Huepeden, Wolters & Co. have taken out and shipped, since Dec. 23d, 2,239.65 ozs. of silver bullion, coin value, $1,913.19.

From the end of the tunnel in the Snow Drift mine, which is 100 ft. in length, a shaft six by twelve ft. is being sunk on the vein, which is 33 ft. in depth. The crevice, between walls, is about six feet in width, carrying on the hanging wall two feet of decomposed gangue. The remainder of the crevice is barren. The lode is evidently a true fissure vein, with solid granite walls, ensliekened, the ensliekened surface being striated horizontally. Ten feet above the present workings there is a body of solid gangue and mineral combined, about 30 in. in width.

CHINA.

The Cheffo mines continue to yield liberally. The *Recorder* says:

A party of men, chiefly Americans, who have been sometime engaged in working a shaft, have expressed their intention of continuing, and do not feel any fear of being attacked by any of the Mandarin soldiers. We have seen a specimen of the ore which has been found, and which we are told by a gentleman of authority, looks very rich in metal. A man who has been some five years in the silver mines of Mexico, declares that it contains 6 per cent. of silver. The men have struck a vein of metallic ore fourteen inches thick, which seems by analysis to consist chiefly of zinc and silver. The Chinese are buying the stuff at $2 per picul. If there is 6 per cent. of silver in it, it will pay splendidly.

IDAHO.

Silver City *Tidal Wave*, Jan. 8th: Black's mill has cleaned up, after a successful run on Rising Star ore, with very flattering results, and is now stopped for a few days,

in order to construct a kiln to dry the ores before crushing.

The Cloud Ledge at Cottonwood is developing into a wider and richer mine as the shaft is put down. Al. Cage came over the mountain yesterday and reports the mines about Cottonwood and Flint all looking more and more encouraging.

Jan. 12th: The Cosmos mill is making a run on Woodstock ore. Bob McVee has hold of the engine. There is talk of running the mill all winter.

The Rising Star Co. shipped by Wells, Fargo & Co., some 500 lbs. of bullion, and the Golden Chariot, $27,000.

MONTANA.

Helena *Post*, Jan. 1st: Mr. Nolan arrived last night from Cable with a bunch of gold weighing 720 ozs. the result of the last run of the Nolan mill.

S. F. Molitor, yesterday ran into proper shape for transportation, a mass of gold which was worth in gold coin, $12,500. It was the result of one run of the Nolan mill at Cable City.

From Silver Star district, we learn that the Bates & Trevit mill is pounding away upon the Iron Rod, and is doing splendidly. There was a large clean up made. The Everett mill on the Green Campbell lode is unceasingly at work, and we may expect to hear of good returns in a few days.

We have the following from Norwegian Gulch: The Sterling Mining Co. commenced drifting the 22d, and are succeeding very well. They propose to continue work all winter....A. A. Master & Co. are sluicing and making wages....A. B. Kiser made a discovery on a bar near Gold Run and are engaged in running a tunnel150 ft. They got from five to ten cents per pan, but are piling the dirt to sluice in the spring. On this bar there has already been over 30 claims recorded....In Sterling, Capt. Maltby is running his mill upon rock taken from the Rising Run, a lode situated in the district. This gulch will perhaps be one of the most busy mining localities in the Territory, and will furnish employment to several hundred men.

NEVADA.

REESE RIVER.

Austin *Reveille*, Jan. 7th: There are at the Manhattan mill in this city five tons of ore which were brought from the Eureka district for reduction. The lot embraces ore from several mines, and is estimated to yield largely of silver. From what we have been able to learn the ore occurs in deposits, as in the district of White Pine.

As much of the ore in the district of Eureka can be most economically reduced by smelting, parties are engaged in the erection of a furnace for that purpose. The works are far advanced, and will be completed within a few weeks. As soon as this happens, a variety of the ores in the district will be brought to the furnace and reduced successfully.

During the period of 90 days the 5-stamp mill of the Monte Cristo Co. at White Pine, reduced 125 tons of ore, the yield of which was $97,700. In the lot 53 tons averaged $1,455.50 per ton; 53 tons averaged $251 per ton; 18½ tons averaged $326 per ton; and five tons averaged $383 per ton.

The vertical shaft which is being sunk for the development of the Chase mine, situated in New York Cañon, has already attained considerable depth through hard, tough rock. As soon as the requisite depth is reached, levels will be run for the vein and ore extracted.

Jan. 11th: There were received at the First National Bank in this city on Saturday evening, nine bars of bullion from Leon & Co's El Dorado South in the district of Silver Bend.

Ten bars of fine bullion were brought into this city yesterday morning from White Pine. Seven of the bars were from the White Pine mill at Hamilton, and are valued at $12,370.26.

Jan. 12th: The following amounts of bullion were shipped by the banking houses at White Pine since their establishment: By the John A. Paxton in November and December, 1868, $96,711.28; by the agency of the First National Bank of Nevada, $33,-240.45; total shipment, $129,951.73.

Five bars of bullion, from what mill was not specified, were brought into this city this morning from White Pine.

Jan. 14th: The Belmont stage last night brought into this city seven bars of bullion—the product of ore from W. F. Leon & Co's El Dorado South—from the Belmont mill.

Virginia *Enterprise*, Jan. 15th: There is considerable excitement along the railroad about some new mines that has lately been struck in the Goose Creek Mountains. A letter to a gentleman in this city, from a friend in Truckee, states that many are going from that place to the new mines. There is also some talk about a place called McCann's Creek, and within the past three days several persons have left Gold Hill for that region. The mines are silver-bearing quartz veins and are situated about 150 miles north of White Pine.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Jan. 7th: The Savage Co. day before yesterday, shipped through Wells, Fargo & Co. nine bars of bullion, valued at $17,261.47, and weighing 667 lbs....The Overman Co. shipped last night 340 lbs. of bullion, valued at $11,-768.65.

The new shaft of the Ophir Co. is now down 622 ft., 612 ft. of which is timbered. The rock is favorable for speedy sinking, and the work is progressing finely....The total yield of the Occidental mine for December, was $38,329.62. The mine is looking exceedingly well and everything is progressing satisfactorily, both above and below.

The first run of the new 16-stamp mill of the Silver Peak & New York Co. on ore from the Silver Champion mine, yielded between $300 and $400 per ton.

In the lower hills of the Palmetto range, near Fish Lake Valley, are some very promising veins of gold-bearing quartz. One of these, the Double Eagle, a vein about two ft. in width, is exceedingly rich in gold; one ton of the rock hauled to Austin and crushed there, yielded $1,615.

Jan. 9th: During the past week the express companies have shipped from this city 5,734 lbs. of assayed bullion, valued at $160,661.54.

About a dozen men are engaged in mining with rockers in the bed of Nigger Ravine, half a mile east of Silver City, with good success. One man is reported to have taken out $110 in five days.

The Gould & Curry Co. are putting in at the Bonner shaft a large and powerful engine for working the pump.

About 150 tons of excellent ore is being raised at the Alta mine daily, and both mills are kept steadily running up to their full capacity.

Jan. 10th: Seventy tons of ore per day is being raised from the Twin mine at Silver City.

The 1,100-ft. station of the Imperial-Empire has penetrated 20 ft. from the shaft, through cement, quartz, etc.; and at that point the true east wall of the ledge is doubtless encountered, as clay and water are found.

Jan. 14th: The Imperial Co, night before last, shipped, per Pacific Union Express, five bars of bullion, weighing 400 lbs., and valued at $8,658.25.

The Hale & Norcross Co. are said to have cut into a body of very fine ore, of late. The men are allowed to pass in and out of the mine at will.

Jan. 16th: The Justice-Independent works, just above the Devil's Gate, started up last Saturday, after a rest of several months.

Jan. 16th: At the assay office of Bonsfield & Co., we were yesterday shown a gold bar from the Sierra Nevada mine, weighing 492 40-100 ozs-, and worth $5,971.96.

The total shipment of bullion from this city for the week has been 4,885 lbs., valued at $122,096.48.

On the 840-ft. level at the Alpha mine, a promising character of quartz is met with, and the general indications of the mine are satisfactory. The Hale & Norcross Co. have a deposit of fine milling ore six ft. in width in their south drift on the 930-foot level.

The Occidental Co. are taking out from $40,000 to $60,000 per month from the portion of the mine they are working.

OREGON.

The Walla Walla *Statesman* says the news from Perry Creek, Kootenai, is very flattering, and anticipations for next season's operations in that vicinity, are that large quantities of the precious metal will be taken out of these mines. The district is supposed to be quite extensive.

DOUBLE-BARRELED GUNS.—It is in most cases, the *left-hand* barrel which bursts. The reason is simply that the right is most frequently used and reloaded—perhaps ten times to the left one being discharged once. Every time the right barrel is discharged the gunpowder in the left is pulverized more or less by the shock, and the settling of the grains leave a space between the charge and the wadding. Hence whence the left barrel is discharged it frequently explodes. These accidents, it is asserted, can be avoided by sending the ramrod home with one or two smart blows into the non-discharged barrel every time the other is reloaded.—*Artisan.*

Engineering.

NIGHT and day the railroad shops in Folsom are in full blast.

A TELEGRAPH line will connect Elko with Treasure City.

SURVEYORS are locating stakes for trestle work on the Oregon Central Railroad, between Oregon City and the Clackamas.

THE San Diego *Union* urges an appropriation of $100,000 for throwing San Diego River into False Bay, which was its ancient embouchure.

THE two thousand piles upon which the Vallejo grain elevator is destined to rest, have already been driven, capped and floored, and the earth filling is progressing rapidly.

IT is asserted on "reliable authority," that within a few weeks a thousand laborers will be put to work grading the Oregon and California Railroad, and that the section between Marysville and Chico will be in running order within six months.

ROLLING STOCK.—The Central Pacific Railroad Company has now in use 180 locomotives, 2,000 platform and box cars for carrying freight, and about seventy-five express and passenger cars,—which figures will have to be about trebled.

THE party of engineers in charge of the survey of the Vancouver and Puget Sound Railroad, arrived at Olympia, on Puget Sound, on Thursday, January 7th, and camped on the plaza. The report will be very favorable for the cheap and speedy construction of the railroad.

FROM BOISE CITY TO PUGET SOUND BY RAILROAD.—Col. J. C. Hudnutt, the engineer in charge of the preliminary survey of the northern branch of the Union Pacific Railroad, addressed the Idaho Legislature, in joint convention, on railroad topics, December 26th, and extended an invitation to his hearers to join in an excursion by rail, from Boise City to Puget Sound, on New Year's Day, 1871. (See Idaho correspondence).

CONSTRUCTION OF A BREAKWATER AT TRINIDAD HARBOR.—The Chamber of Commerce, urged by north coast shippers and lumbermen, has set on foot the construction of a breakwater extending from Trinidad head to a rock in the little bay behind it, which will shelter shipping from southwest storms, the only one to which the breakwater would be exposed; estimated cost, according to W. F. Weston, C. E., $653,-685. The lumber shipping interested in having such refuge, floats 300,000,000 feet annually, represented by $15,000,000 capital.

THE SOUTHERN PACIFIC R. R. Co. has changed both its management and its proposed route, which is now laid through the coast range beyond Gilroy, into Tulare Valley, along its eastern shore, and along the 35th parallel to Colorado River; ignoring the coast counties altogether. T. J. Arnold and a corps of assistants, are about to leave this city for a surveying trip through the coast range passes,—Panoche and Pacheco's. The Southern Pacific Railroad Company have a contract for the purchase of the San Francisco and San José Railroad, which will give the Consolidated Company the control of the continuous line from this city. The new directors are Tevis, Barron, Mills, Robinson, Cunningham and Bell.

Already the Eastern Division of the Union Pacific Railroad is completed and running to Fort Wallace, on the Western boundary of Kansas, 700 miles west of St. Louis. From that point to the Needles, on the Colorado River, is a distance of 900 miles, and the connection between San Francisco and the Needles would be 500 miles, making 1,400 miles in all necessary to complete the junction with the Eastern line.

French Government Engineers.

Fleming Jenkin, F. R. S., in the course of an inaugural address delivered in the University of Edinburgh, spoke of the engineers of France, as follows:

"These government officials correspond to our civil engineers; they are allowed, and even encouraged, to enter the service of private companies and large establishments, but remain all their lives members of their corps; and supported as they are by Government patronage, by tradition, by their *esprit de corps* and mutual assistance, and lastly, by their acknowledged distinction and honorable conduct, they enjoy so great an advantage over any independent man who may try to compete with them, that the engineer proper only exists as an exception in France. Once a member of the corps, a man is honorably provided for in life: he enjoys rank, certain promotion, a fair income, and, if he have original talent, a certainty of opportunities of largely increasing that income.

Being public servants, French engineers are educated by Government, and in great part at Government expense; the career, being so advantageous, is desired by the *elite* of the French youth, and hence in the competition which determines the admission of students to the Polytechnic School, as the school of engineers is termed, we see 900 picked pupils of eighteen and nineteen, each straining every nerve to win one of 150 appointments annually made. I believe that there exists no competition in Europe comparable with this. The great severity of the examination is so well known, the fact that five out of six must fail, is so obvious, that none but young men who have already gained distinction in the great public schools dream of competing. In this trial they are examined in plane and solid geometry, in analytical geometry of two and three dimensions, descriptive geometry up to curved surfaces, algebra, including the general theory of equations, series, functions simple and derived, etc., physics, chemistry, an odd language or two, and shaded mechanical drawing. But the select 150 are for two years longer employed in purely theoretical studies, that is to say, the higher mathematics, theoretical mechanics, mathematical physics, curious problems in descriptive geometry, with a little drawing and language as recreations. During these two years each is engaged in a daily struggle for about five and twenty highly-coveted posts. The three who are at the head of the class list at the end of the two years gain the proud title of Engineers of Mines, the rest are humbler members of the Ponts et Chaussées, while the 125 who fail have to content themselves with looking after the State factories for powder, tobacco, or saltpeter, or, worse still in their estimation, they sink into mere royal engineers or artillerymen."

CANAL TO OVERCOME WILLAMETTE FALLS. The Oregon legislature has subsidized, and some capitalists have undertaken, the construction of a canal around Willamette Falls, which is to have four locks, in a distance of 3,000 feet, to overcome forty-five feet, and the cost of which is estimated at $300,000. Oregon City, located there, is highly favored as to water-power, and is expected to become a great manufacturing place. Willamette Valley will be much benefited.

THE COARSE ARTS.—"The fine arts do not interest me," said Theodore Parker, "so much as the coarse arts, which feed, clothe, house, and comfort a people. I should rather be a great man as Franklin, than a Michael Angelo—nay, if I had a son, I should rather see him a mechanic, who organized use like the late George Stephenson, in England, than a great painter like Rembens, who only copied beauty. In short, I take more interest in a cattle show, and feel more sympathy with the Pope's bull, than his *bul-lum*. Men talk to me about the absence of art in America. You remember the stuff that M—— used to twaddle forth upon that theme, and what transcendental nonsense got delivered from gawky girls and long-haired young men. I tell them we have cattle shows and mechanics' fairs, and plows, and harrows, and sawmills, sewing machines and reaping machines, threshing machines and planing machines. There is not a sawmill in Rome. I doubt if there is one in the Pontifical States."

ABOUT the first of next month stages will run from Carlin, Central Pacific R. R., to White Pine -a distance of 97 miles.

MINING AND SCIENTIFIC PRESS.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

A. B. BUTLER, California, agent and correspondent.
WM. H. MURRAY, California.
DR. L. G. YATES, California.
S. H. HERRING, California and Nevada.
T. G. ANDERSON, Nevada.

Resident Agents.

WHITE PINE DISTRICT.—Alexander Bruckman, Hamilton, Nevada.
HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
A. S. Hopkins, No. 70 J street, Sacramento.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866

San Francisco:
Saturday Morning, Jan. 23, 1869.

Notices to Correspondents.

EOLUS.—The winds of California obey the same natural laws which rule in other localities, and possess no peculiar features other than what would obtain in any country similarly placed, as respects geographical and physical circumstances. Our prevailing westerly winds are chiefly attributable to the heating action of the sun's rays on the valley lands, foothills, and the western slope of the Sierra Nevada; thus rendering the atmosphere lighter than that which rests on the adjoining Pacific, from which the cooler and heavier air rushes in, to replace the heated and lighter air lying over the land. This action is further facilitated by the sloping form of the Sierra Nevada, up whose sides a constant upward current of lighter air flows, equivalent to the inflow of the cooler and heavier air of the Pacific.

L. P.—Heat in its radiant state does not raise the temperature of the media which it p o luces; a tube full of ether may be held in the focus of a burning mirror without becoming sensibly hotter, but the moment the absorption of the rays is caused in any way, as by introducing a piece of charcoal into the liquid, the ether enters into ebullition and becomes dissipated as vapor.

GUANO, Gilroy.—The fertilizing properties of guano almost solely reside in the phosphate of lime and urates which it contains. The former acts in the same manner as finely pulverized bones; the latter is valuable because they eventually become converted into ammonia.

SOAPSTONE, Shaw's Flat, Tuolumne Co.—The answer to your question is crowded out. We shall take occasion to add thereto next week.

THE NEW STANDISH STEAM PLOW.—Our notes in regard to the new 100-horse power Standish steam plow—a great improvement on the first one constructed, and really promising to be a triumph in view of its capacity to do economically the work intended—now nearly completed at the Union Foundry, and to be in running order in a few days, are reluctantly laid over till next week. The work done by Mr. Standish in Contra Costa County lately with the plow heretofore described in the PRESS, made such favorable impressions upon the minds of all who took the pains to examine into the operations of the plow, that the general verdict on rotary knives with locomotive power, without traction, has, we are glad to see, gone forth, pronouncing it a success.

EXPERIMENT IN BLASTING.—An attempt is to be made at Fort Point to-day (Saturday) to blow up with the Hafenegger powder a submerged rock forty feet long and fifteen feet wide.

New Steps in Metallurgy.

During the lull in mining enterprise which has characterized the past few years, a conviction has gained ground among millmen and others who are most thoroughly identified with mining pursuits, that our future road to advancement in that branch of industry lies in the direction of economical metallurgy. Many able men, on this coast, of scientific acquirements, and extensive experience in working of ores—men capable of originating something new where there are necessities in the case demanding it—have been devoting their best talents and unstinted energies to problems of the kind. While we should be slow to herald any new process in empyrical metallurgy as a success, beyond its merits, it devolves equally upon us that we should not preclude, in our minds, the possibility of any new or really valuable improvement, in practical manipulation or in principle, being hit upon by persons not masters in theory or in science. All new processes must bide the test of time; and everything is worth, trying, if we are to make any substantial advancement in the arts of metallurgy.

Besides the Rivot and Hagan hydrogen-burning furnaces, and the Nolf electric decomposition process, there is another new amalgamation process now in an advanced stage of development in this city, which is worthy of our attention, involving new combinations of principles, and the results of which, it is claimed and promised, will effect the reduction of the base metal ores at the extraordinary low figure of three dollars a ton. It is a dry process, with the application of dry chemical reagents and of electricity. As careful assays and comparisons with the ordinary methods of working are being made and certified to, we hope to be able to present the details soon in a properly tangible shape.

Title to Layer Deposits.

White Pine is much befogged, and clouded, possessorily and prospectively, under inky questions of law. The great Eberhardt trial is in progress at Austin, and acute lawyers, duly stimulated by the occasion, are practicing the art of baudying each other's witnesses as lawyers know exceedingly well how to do, where a few millions of dollars are involved. As in the great Comstock trials, at Virginia City, the result depends to a considerable extent on the opinions of geologists and experts. Of these there is no lack, persons ready to express their opinions; and the competent and honest, no less than the partially reliable and the dishonest, are treated in turn to the delicacy of "eating their own words"—as they had it at Virginia,—and more too, with legal sauce. The ores in question being those actually exploited, are generally conceded to be of the nature of layer deposits, from infiltration, and belonging to the bog-iron and manganese class, which are, or ought to be, held by their superficial extent, independently of the question of the origin of the metal so deposited. If neither the district miner's law, nor the general law, provides for a superficial location,—no law existing to fit to the facts of nature in the case,—the determining issue seems to recur to the question of how far a defective law is to be followed to the letter, in order to meet out justice, or, in its stead, the intention of general United States and foreign laws and precedents, governing as in the case of bog-iron and placer gold mines; which certainly are, and ought to be, applicable to claims of title by superficial extent.

FAMILY VELOCIPEDES.—We saw recently at the Pioneer velocipede establishment (Golden State Foundry), a three-wheeled velocipede, which might be designated as a family vehicle, it being of sufficient capacity to carry several individuals at once. With experienced operators it has run at the rate of a mile in 3½ minutes.

New Maps.

Photographic copies, in sections, of Mr. Montague's beautiful Central Pacific R. R. maps, showing numerous and accurate details of the interior not heretofore represented, may be seen at the office of Calvin Brown, C. E., No. 615 Sacramento street. These maps were made principally from the notes of Butler Ives, C.E., the exploring and locating engineer of the road, to whose excellent qualifications for that duty, great energy and peculiar talent as an explorer, are due the credit of marking out, the favorable and favored places where the iron line was shortly to be traced, for civilization to display its magic influences in the deserts. Data here jotted down, are the results of years of the most arduous labor, in the reconnoissance of available passes, and of the most favorable routes,—involving the climbing of the principal commanding mountains, and the execution of a complete system of triangulation connecting and locating every visible point between the California boundary and Salt Lake, and including the observation everywhere of hights, barometrically.

A new map of the State of Sinaloa is being completed by Col. Charles E. Norton, C. E., which will be very minute in its details. The agricultural districts and products; the mines of gold and silver; with roads, rivers, ports, etc., are noted with much exactness, as also the population of all the principal towns.

Amongst the new maps exposed for sale, C. D. Gibbs, C. E. has compiled from "authentic sources" a little map of the White Pine district, including portions of the counties of Nye, Esmeralda, Churchill and Humboldt, and the western border of Utah. It is about eighteen inches square, and not very nicely executed, but shows the geography and topography of the country sufficiently well to make it quite useful.

Another map of White Pine has been published by William McMurray, C. E., which is much larger,—about three feet square,—and better executed, but embraces a smaller section of country; containing, however, a great deal of valuable information about the geography, mines, etc., in the vicinity of Treasure Hill. On the margin is a section through Treasure Hill, showing the location of the principal mines. The geological points of the district are not taken notice of, or represented, in any manner, in either of the above maps.

Frey's Topographical, Railroad and County map of California and Nevada, is a well-gotten-up New York publication on about the usual scale, just issued; showing some improvements and corrections, and leaving room for a great many more, which are not, however, wholly to be laid to the charge of the author, in the present imperfect state of the surveys.

ACADEMY OF NATURAL SCIENCES.—A regular meeting of the California Academy of Natural Sciences was held on Monday evening, Jan. 18th, the President, Dr. Blake in the chair. W. Frank Stewart of San José, and Professor George Davidson of the United States Coast Survey, were elected resident members. President Blake presented specimens of the carboniferous formation in an imperfect state of formation, found on Treasure Hill, White Pine District. A specimen of fungus, incorporating acorns in its growth, found near Martinez, was presented by Mr. Mathewson. Remarks were made by members upon the lower forms of organized matter, and President Blake was requested to give his views at length upon the subject at the next meeting of the Academy. Dr. Cooper announced that the printed proceedings of the Academy for 1868 were ready for distribution. He also moved that the members of the Academy be divided into classes on Botany, Mineralogy, Conchology, etc., in order to a more thorough investigation of the respective branches. The proposition was discussed and finally withdrawn, after which the meeting adjourned.

Creating a Vacuum by Means of Falling Water.

Mr. Gordon, of Bush street, near Kearny, makes use of the Torricellian method of creating a vacuum, and recommends its application for the exhaustion of air in manufacturing processes; as in the kyanizing of wood, the making artificial stone by the Ransome process, etc. The principle is, that in an inverted tube which has been filled with any fluid, the escape of the fluid below, creates a vacuum above it. This fact having been first discovered by Torricelli, the vacuum has been called the Torricellian vacuum. It is on the same principle that the mercurial barometer works; a 30-inch column of mercury draws a short vacuum above it, which is counterbalanced at the other end by the pressure of the atmosphere—which varies about three inches. In other words, the weight of the atmosphere forms a counterpoise to just 28 inches of mercury; but when there are 30 inches of mercury, its weight will create a vacuum. Water being one fourteenth the weight of mercury, it will counterpoise the atmosphere at a height just fourteen times as great—or 32 feet, as we find in pumps, by the height that the water rises therein.

Mr. Gordon has a tank, and an exhausting vessel, fitted up in his working room, to demonstrate the practical availability of this principle for the exhaustion of air on a large scale. Below the tank is a pipe something over 32 feet in length, and near its upper end is a joint connecting with an exhausting vessel. When the water is let out below, this vessel is exhausted; then the valves are closed, the empty space above, in the pipe, is refilled from the tank, and the operation is repeated; exhausting still further the air in the exhausting vessel. This operation is repeated six or eight times, until there is a more perfect vacuum shown by an attached column of mercury than can be obtained with the air pump. Mr. Gordon's apparatus is very simple, and durable; the only requisite is plenty of water, with a sufficient fall. In the kyanizing and stone manufacturing processes in this city—where the air is exhausted in order that chemical solutions shall be forced in to supply the vacuum,—it is found more convenient at present, however, to accomplish the result with the air pump and steam power.

A GOOD WORD FOR US.—We clip the following appreciative notice from the *American Gas Light Journal*, of Dec. 2d. The initials at the bottom show that it is by Prof. Henry Wurtz, whose *Chemical Repertory and Chemical Excerpta* constitute of late, so important and valuable a feature of that journal. Such a notice, from such a pen, is most gratifying. We shall cordially welcome such contributions as he proposes to make to our columns:

THE MINING AND SCIENTIFIC PRESS, OF SAN FRANCISCO.—Of this important journal, thanks are due to the editors, for the recent receipt of complete files for some two years back. The assiduity and discrimination of this journal in the collection of scientific intelligence, are wholly without parallel in a community so young; and its columns convey a striking view of the surprising activity of inquiry, invention, and even of discovery, in our Pacific States, whose gigantic future needs no prophetic power to foresee. The "embarrassment of riches" is the predominant emotion produced by inspection of its overflowing columns. Effort will soon be made, however, to mete out, within our crowded space, such small justice as may be to Californian progress, and to this, its most worthy exponent.

Under this head, I can now but add that, perceiving recent communications in the PRESS from some of its able and intelligent local scientific contributors on the mode of formation of gold nuggets, to which I have myself given some study, I feel it not altogether out of place to say that I propose soon to contribute my own mite to this discussion through its columns. H. W.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Work at the Foundries.

The Union Foundry, Booth & Co., is employed apparently at its fullest capacity; presenting to the eyes and ears of the visitor a complete picture, with all the acoustic accompaniments, of an industrial pandemonium. Amidst this bustle of hundreds of grimy mechanics, and all this havoc of dreadful noises, it is a pleasant characteristic of the Union Foundry that every operation seems to be going on without disturbance from any other; that everything fits, without making any odo—that the work, in short, goes forward methodically. Another feature characteristic of the place, which requires only the use of one's eyes to discover, is that the managing ones are well up with the times in everything new relating to their business, and even to the business of the patrons of a foundry.

The metallurgical rooms up stairs (formerly occupied by Prof. Blake) and the little amalgamating and mill room with the drafting room adjoining, are still, as of old, a kind of metallurgical college where the men from the mountains teach each other in all kinds of good, bad and indifferent processes; though the real advancements in chemical, as well as in mechanical points, made in gold and silver metallurgy in places like this on the Pacific Coast, are not by any means to be scouted; and are, in a number of cases that might be enumerated, meeting with the recognition of wiser people who look at such matters only from a scientific stand-point.

Dry crushing being found advantageous in the treatment of rich ores, where water would carry away too much of the precious metals, Mr. J. E. Clayton has been giving his attention to the construction of a battery, whereby shoveling and repeated sifting may be avoided—a self-feeding, constant sifting, and self-discharging arrangement being effected by means of properly curved screens, and suitably shaped stamp boxes, so placed that the finely-pulverized ore will pass off dry, in precisely the same manner that water and ore are splashed through the screens in wet crushing.

A dozen tons of tin ore from Temascal, are being worked up at this place for L. L. Robinson, Pioche & Co., by a method of crushing and concentration which is at present only experimental, though on a working scale; the mechanical contrivances being ingenious modifications of old and well-known machines, adapted to either wet or dry crushing.

Last week there was shipped from the Union Foundry a mammoth cylinder for the new Rivot hydrogen roasting furnace at Nevada; for Mr. Bausac, of the "Freuch Mill," at that place, representing Professor Rivot of the *Ecole des Mines*, Paris. This was one of the largest and most difficult castings ever made on the coast; the cylinder measuring fourteen feet six inches in length, six feet in diameter, and weighing 21,360 pounds. It was cast on end, on New Year's day, Mr. Scott having availed himself of the freedom from visitors presented by the day, for the execution of his very delicate task. His success was complete, the cylinder, as cast, proving quite perfect. Iron was melted for it at the rate of 1,000 pounds for every eight minutes, and allowed to flow, until there was enough, into a large tank, whence it was drawn through a gate. The arranging of the mold took three weeks' time.

This Rivot process appears to be new. It is a revolving roasting furnace, for pyrites. The cylinder containing the ore is heated from the outside, and the steam conducted into it at one end and through the center by means of a perforated copper pipe, in such a manner as to become mixed with the glowing ore, and decomposed and burned during the process. Messrs. Matthie & Gilliardon are among the interested parties at Nevada.

A fine locomotive is being made for the Napa Valley Railroad, 14x22, with five feet drivers. The only other place in the city where locomotives have been put together is the Vulcan Foundry.

Some superior Horu amalgamating pans have been made—one large one, five feet in diameter and three feet deep—for the French mill, in Nevada County, and one for Joseph Trench, Silver City, Nevada.

The Vallejo elevator is being made here. It is a large job, being the first elevator built on the coast. Grain arriving loose in ships can be scooped up and drawn out by means of an adjustable proboscis, called a "boot," elevated four or five stories, and stored for re-shipment. The engine is a 150-horse power—a patent Scott & Eckart cut-off. The Vallejo Elevator Company—Messrs. Friedlander, Frishie, Rico, etc., are the parties.

A large 16x36 engine, of about 90-horse power, for Elam & Howes' wood manufacturing establishment (recently burned down) is nearly finished.

Some improvements have been attempted at the Union Foundry lately in the way of boilers. A lot of car wheels and axles have also been made for the Black Diamond Coal Mining Co. of Mt. Diablo.

At the Phœnix Iron Works, large and improved fire-proof safes are still the principal product.

At the Atlas Works, iron fronts afford constant work, presenting a good deal of activity. A job in hand at present is for a large building at the corner of First and Market streets. A bank front for A. H. Houston, on Califoania street, has been ordered; also a store front for Moses Ellis, on Clay street; and a job for a commercial house to replace the Eureka Hotel on Pine street, for Mr. Land, of White Pine, is nearly finished.

Clerc & Co., of the City Foundry, report being busy.

The Hagan Furnace.

The new water-decomposing roasting furnace put up at Angels, Calaveras County, for the Angels Quartz Mining Company, has been for several weeks awaiting the completion of the amalgamating pans, and will be in operation in about ten days. A degree of efficacy in desulphurization equal to kiln roasting, is certainly to be counted upon; but the operators claim a great deal more, and refer to their working results, as owing to modifications in the arrangement and dimensions of the furnace, made since the unsuccessful trials in 1866; in regard to which, the following letter, pointing out the difficultics then encountered, will be found interesting. We are informed that the proper tests will not fail to be made, in such a manner as to be satisfactory to all inquirers, and sufficient to answer all objections that can be made:

"I see attempts are being made once more to bring this furnace into favorable notice. As it is about time its merits were established, I will state that in October, 1866, I pronounced it a failure, as the result of my examination of two operations on lots of about ten tons of ore, one of which consisted of arsenical sulphurets of iron, in a gangue of tough, compact, granular quartz, and the gangue of the other was more open in seams. The result in both cases was a complete failure to desulphurize the interior of the masses, whilst on the outside the iron was found in the state of *peroxide*, as also where seams or cracks penetrated the lumps; but a fresh fracture always showed the sulphurets, which had suffered the change due to heat alone.

I assisted in the analyzation of a part of this ore which yielded but poorly. It was *claimed* that the portion amalgamated after I left yielded about double as much, but the fine sulphurets from the tailings showed no gold till treated with an acid, and then it became visible in abundance.

It may be that hydrogen can desulphurize masses of ore as stated, but I am satisfied from observation that the reactions claimed do not take place to any extent; but be this as it may, the facts in the cases cited were as I state.

It would seem that the question as to whether this furnace does or does not remove the sulphur, etc., and free the gold, is one that need not take years to prove. The owners are rich; why do they not employ a *competent* person (such an one can certainly be found in San Francisco,) to examine and report? CHAS. H. AARON.

Lone Pine, Dec. 27th, 1868.

WHAT IS NEW IN THE NOLF PROCESS?—EDITORS PRESS:—Your article entitled "Amalgamation by the Aid of Electricity," ought to command attention on the part of those interested in the reduction of ores, and a few comments may not be unacceptable. When the ore is a *sulphuret*, the operation of the current is highly successful. The quantity and intensity best adapted for the purpose was pretty tolerably ascertained by Mr. John Scott, after lengthened experiments, *ten years ago*. The remark that Mr. Nolf is no *new* experimentor in this field of investigation, is, therefore, correct. Without wishing to detract from the unquestioned abilities of that gentlemen, it would appear that the combination of amalgamation with electrical decomposition is the new feature of his process, while the application of the electric current to decompose the ore and re-decompose the resulting product, was the invention of a previous experimenter in the same field.

San Francisco, January 20. J. G.

MOUNT DIABLO COAL.—A combination has been effected between the several coal mining companies at Mt. Diablo, whereby one agent in this city is henceforth to receive all the coal produced by all of them and shipped for sale or delivery in this city. A coincidence worthy of remark is that, whereas the price was formerly $6 a ton, delivered on the wharves at San Francisco, it is now $8.20. The arrangement is to last for five years.

VALUABLE contributions will be found on the inside pages, from J. E. Clayton, on the Salurian Rocks, and Mining in Southern Nevada; from C. H. A., giving interesting details with regard to smelting in the Owen's River country; from "Minero," in the mountains of Mexico; and from John Scott, on the decomposition of silver ores with the aid of electricity.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 2tv17-4m

O. M TAYLOR, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

A SHORT ENGAGEMENT. The person who visited Yuba, Sierra, and Plumas counties, last fall, as agent and correspondent of the PRESS, only continued a short time in that capacity.

Mr. Mowry, lately a clerk in a hotel at Colfax, is requested to call at the office of the MINING AND SCIENTIFIC PRESS, No. 414 Clay street, below Sansome, San Francisco.

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

PAIN KILLER.

No article ever attained to such unbounded popularity.—*Salem Observer.*

An article of great merit and virtue.—*Cinn. Nonpareil.*

We can bear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch.*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Tenn. Organ.*

It has real merit: as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*

It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.* 26v17-1m

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hamsbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

DR. NESTELL'S

LUNG INSTITUTE,

(Branch of the N. Y. Lung Institute)

No. 516 SUTTER STREET,

Between Mason and Powell Streets, San Francisco,

For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.

Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.

Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.

Invalids at a distance, on writing their case, can receive the remedies by Express.

Special attendance out of the city will be charged commensurately with the time and distance occupied.

All communications must be addressed to

D. D. T. NESTELL, A. M., M. D.,

Zelner, the best and most convenient and portable apparatus containing Chlorine, for rooms, which we consider the best disinfectant out, and should advise all housekeepers not to be without one. Price $1, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 18 Geary street, 25v17-3m

Interesting Smelting Details from Cerro Gordo.

EDITORS PRESS:—My friend, M. P. Desormeaux, of Cerro Gordo, (Inyo County,) again reports progress as follows:

"I have now the pleasure of announcing to you the great success which I have obtained in a new furnace, which I invented myself. * * * By the result of my trials I was convinced that by means of *scorification* I should succeed completely in treating the galenas, which are furnished in large quantity by several of our mines, and which have been used heretofore only as fluxes for richer ores; but which my invention will render the most valuable in Cerro Gordo, as the quantity of ore from other mines is extremely limited at present for want of capital to develop them.

"After much thought I adopted the plan of a reverberatory furnace,—a double fusion, that is to say of which the basin or receptacle is in the middle of the furnace, receiving the melted ore from each side. My furnace is twenty-two feet long inside, by six feet wide with lining (chemise) of firebrick. After thorough drying, the furnace was charged with 1½ tons of galena from the Union mine, well spread on the hearth, after four hours' scorification, the heat was raised to produce agglomeration, which continued two hours, when complete fusion being obtained, I proceeded to draw the contents, having succeeded completely in my purpose, which was to disengage a large portion of the sulphur, antimony, arsenic, etc., contained in the galena, and which is thereby more easily and advantageously reduced in the upright furnace.

The campaign lasted fifteen days and nights, and the furnace was not in the least injured. I scorified forty-four tons of galena and nine tons of other ore, in all fifty-three tons, which yielded thirty-five bars of lead in spite of me, for I did not try to get it out. The remainder is scorified ore containing still some sulphur, but which can be readily reduced in the blast furnace without flux.

The following figures will convince you of my success:

18 cords wood at $5	$ 90 00
15 days work, 4 men, at $4	240 00
Supervision	150 00
Candles for night	10 00
Repairing tools	10 00
Total	$500 00

The thirty-five bars of lead weigh 1½ tons, and contain an average of $500 per ton in silver.

The ore will probably yield in the final treatment in the blast furnace, about 20 tons of lead; which will contain about $250 per ton,—$5,000; from which is to be subtracted as cost of the ore and expenses of the second operation."

For my part I must say I don't see much novelty in Mr. D's method, which seems to be only a slight modification of common practice.

Such is his report, however, and you may do as you please with it. If he can make the galenas of C. G. pay *alone*, it will be a good thing, for really I cannot see a great deal else in the district, except the San Ygnacio mine, which I believe to be valuable, though it is hardly an exception, either, as it contains a great deal of galena.

Owen's Lake continues to rise, being now at least ten feet higher than at this season last year. I have made a partial examination of its waters, and find them to contain about five per cent. by weight of solid matter, consisting of chloride, carbonate and sulphate of sodium. I failed to detect salts of potassium, which do not exist in any great quantity. When agitated by the wind, the lake emits a smell of sulphureted hydrogen. C. H. A.

DEWEY & CO.,

American and Foreign Patent Agents,

Publishers and Proprietors of the MINING AND SCIENTIFIC PRESS, the only well established successful Patent Agents on the Pacific Coast, will give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

DEWEY & CO.,

Patent Agents, Publishers and Printers, 414 Clay street below Sansome, San Francisco.

A. T. DEWEY. W. B. EWER.

The Union Pacific Puget Sound R. R.—Velocipedes in Idaho.

EDITORS PRESS:—The survey party of the U. P. R. R. are in town. As nearly as I can learn, on reaching King Hill, they were making a true course for just about Boise City, with good grade. They were afraid to go farther up the country from Snake River, fearing that if they got up as high as "Big Camas Prairie," they would be troubled with snow, where it falls about two feet to two feet six inches on the level, although of course it is deeper where it drifts. The surveying party, however, seem afraid of that route, but as we think, without good cause; and further than that, along that route there is timber sufficient for all their needs, and land worth something, whilst on the Snake River,—that is, bending around King Hill, down to Snake River,—the whole country is one vast desert covered with lava and sagebrush; and again, as King Hill forms nearly a bluff at Snake River, it becomes necessary to descend to the river bottom, and thus grade is lost, which it is almost impossible to regain so as to touch this town.

The difference between the two routes will be spoken of at greater detail hereafter.

VELOCIPEDES IN DEMAND.

There has been a great deal of talk about velocipedes here, and not only our citizens of Ada County, but the adjoining counties express the wish that they were introduced into Idaho. This county is almost level, so far as traveled roads are concerned, and we opine that a good many (for a popnlation as small as ours, say 1,500 voters) could be disposed of, if not too dear.

Will not some enterprising California merchant bring an invoice of some here, or send an invoice to some one here to sell for him? Being totally unacquainted with their make, weight, size, or cost, I cannot give any information, but would be willing to get and give information, or even introduce them here.

Some of our people have taken the "White Pine Fever," and require a dose of "Snow Shoes" and freezing on the top of the Sierra to cure it.

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only
GOOD SAUCE.
The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for
Lea & Perrins' Sauce,
and see that their names are upon the wrapper, labels, stopper, and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, Lea and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.
Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

JOHN W. QUICK, Manufacturer,
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me. 5v17-1y

Removal and Partnership.
Notice is hereby given, that I have removed from my old stand on Beale street, and have formed a co-partnership with Mr. A. CAMERON, for the purpose of carrying on the business of Stair-Building, Wood-Turning and Scroll Sawing. The business will be conducted as formerly at Cameron's, corner of Market and Beale streets, and also at Nos 185 and 187 Brannan street, where ample steam power and all necessary facilities have been provided for every branch of the business.
Different sizes of Red wood Balusters constantly on hand for sale. Also Spanish Cedar, Walnut and California Laurel.
15v17-3m N. P. LANGLAND.

Notes from Montana.

[FROM OUR REGULAR CORRESPONDENT.]

A HACKNEYED INTRODUCTION,

is one which treats of the weather; yet we should feel that we no longer deserved to enjoy the sunny and cloudless skies which now emile upon us, if we did not at the outset contradict the assertion which certain chilly and churlish croakers have given to the world in a somewhat profane statement that "Montana hae nine months winter and three months d—d cold wcather." It is now Christmas week, and placer mining operations are hut just suspended. There is not snow enough to cover the ground, no sensational items with a "Found Frozen" heading have come to the relief of local editors, and the overcoat trade is light. While far to the south of us, on the line of the U. P. R. R., the roads are blocked with drifts of snow, our roads are in fine condition, and all our territorial coaches make their runs on schedule time. The truth is, Montana has been fearfully slandered, on the weather question, and these slanders have, in many cases, heen the scapegoats upon which have been saddled those misfortunes which might much more consistently havo been attrihuted to the shiftless and unenergetic disposition of the complainants. The climate is, in fact, much more mild here than in Chicago or New York, and more favorahle to mining operations than in the districts south of us, where the greater elevation more than counteracts the advantages which would otherwise he derived from a lower latitude. During the winter of '64 and '65 placer mining was prosecuted almost without interruption in this territory, and a similarly favorahle state of affairs existed last winter. This season has not, thus far, been an exception to the rule, and even if it ehould be, Montana has now so far advanced in her career as a mining country that no injurious consequences would he felt.

HER QUARTZ MINES

are so far developed that they can furnish employment to thousands of men during the entire year, and can offer "situations" so far below the enrface that changes of temperature which take place above ground are not noticed. More especially during the winter months are our quartz mines worked to their full capacity; this being the case from the fact that ledge-owners can then employ men at snch low wages—from $45 to $50 per month, and hoard. Some prominent mine-owners are in fact pursuing the policy of crushing custom rock during the winter months in their mills, and puttiug as many men as they can possibly employ at work taking out ore from their own mines,—the ore thus taken out to be crushed during the summer, and the mines allowed to lay comparatively idle during that season of high wages. While this plan of taking out one's ore during the winter and crushing it in the summer greatly reduces the expense of working, it at the same time aids in the development of the country by allowing several months' time for testing rock from such new ledges as may not have been sufficiently opened to warrant the erection of mills upon them. With this latter class of ledges Montana is plentifully supplied; in fact the hooks of the several County Recorders preseut a curious entahlature of quaint appellations which have been manufactured to order for thousands of supposed discoveries, not one hundredth part of which will ever pay for the time expeuded in the invention of their names. Aud yet we regard these "wild-cat" properties as an endorsemeut of the quartz mines of Montana, for it is rarely that we find a counterfeit unless it is based upou a genuiue possessed of real merit. Of these genuine ledges, the

WHITLATCH UNION MINE

is one of the oldest, the hest developed, and the ooe which is more widely kuown than any other. Discovered in February, 1865, hy the well known Jim Whitlatch, an old and fortnnate Nevada miner, it has heen worked with such energy that it now contains over two miles of shafts, tunnels and adits, and has been traced and proven good for a distance, measured along the ledge, of 2,600 feet. The longest shaft upon this ledge has now attained a depth of over 400 feet, at which point the influx of water is so great that the work cannot he prosecuted further towards antipodes until steam pumps are erected in the spring. The first money was realized from this ledge in the summer of 1866, when the first thousand tons of ore yielded an average of $63 to the ton in gold. Since that time over 32,000 tons of quartz have been taken from the mine hy seven different companies, which have yielded over $1,000,000, or at the average rate of a little over $30 to the ton. The highest yield ever made hy this quartz was $87 in gold to the ton, on 90 tons of rock. At present the mines are being more energetically worked than ever before, and are employing ahout 700 men. The ledge which at first was not over a foot in width, and which, during the first 200 feet dipped at an angle of only about 31 degrees, now has a dip of ahout 45 degrees, with well defined walls, "slickensides," of an unmistakahle description, an average width of 3½ feet, and all the characteristics of a permanent vein. More than all, it possesses that attrihute without which all other qualities are useless—it pays. From 75 to 100 stamps are constautly running upon it, and find it profitable to do so. The ore now in sight in the mine, and which can he reached without going to any greater depth thau that now attained, and which can he more easily mined than that already taken out, surpasses in qnality the rock which has been crushed, and is sure to yield one million more.

The situation of this mine is four miles back from this city, in the spurs of the main range of the Rocky Mountaios, and it has already given birth to the hrisk town of Unionville, with its hoardiug-houses, stores, saloons, and the usual appurtenances of a quartz mining camp.

Many items of iuterest are deferred until our next. EVERYWHERE.

Helena, Dec. 22, 1868.

VELOCIPEDE PROGRESS.—Alexander Badlam and others have been practicing self-instruction at the Mechanics' Institute Pavilion, in the art of keeping upright and traveling on the velocipedes, having rented that place for use as a "velocipede school." Occasionally one of the machines is seen on the streets, hut it is seldom that they travel well enough to admit of the trip upon them being called a success; notwithstanding which, the numher of velocipedes is increasing, especially amongst the sedentary and amongst people of leisure, including some ladies; and practicing is carried on, mainly in private, somewhat in the same manner and with the same objects as skating—for amusement and for exercise. For some reason or other the new inventions in the way of velocipedes, are slow in making their appearance, hut we shall certainly have several new things in that line to describe next week. Inquiries are made on the subject from many points in the interior; in reply to which it may he stated that the velocipede will run only on tolerahly smooth roads, and on an up grade where a horse might be able to keep up an easy permanent trot, while for traveling down hill they are admirable under all circumstances.

"LETTERS PATENT" is the title of a small illustrated advertising sheet issued by Messrs. Fuller & Co., No. 109 Montgomery street, agents for the sale of patent rights, patented articles, etc. They have quite a nnmber of valuable rights for sale, and evince commendahle enterprise in their bnsiness.

PROF. RIVOT, of the French *Ecole des Mines*, Paris, will visit this country next fall, for the purpose of superintending personally the operations connected with his new water-decomposing roasting furnace at Nevada. This is a revolving cylinder (described in the column on foundries), the old reverheratory shaped furnacehaving the same chemical results in view, being discarded for the preseut.

About the Imperial Silver Quarries Company.

EDITORS PRESS:—Permit me to correct a statement which appeared in your valuahle paper of 9th inst., under the head of the Imperial Silver Quarries Company.

The Imperial Company, so far from being wound up, as there stated, is now, and has been ever since I took possession of their valuahle property in this county, nearly twelve months ago, prosecuting the work of development uninterruptedly, and as fast as men and means can do so. Already 660 feet of tunnel 6x7 have heen driven through hard rock, day and night, to cut a parallel helt of ten ledges, presenting on surface first-rate indications. On each of these ledges the company own 1,000 feet, as well as 1,000 feet on all hlind ledges to he discovered by the tunnel, and they are now within 130 to 150 feet of the first of these.

An attempt, however, was made about the time referred to, hy a party who had acquired a certain dehenture bond, issued to the vendors by the old directors in part payment of the purchase price,—to compel the present directors to pay him ioterest thereon,—the company heing yet without any return from their claims.

The present directors,—men of the highest standing and social position in London,—very properly refused to pay interest out of principal suhscribed by them and their friends for the express purpose of developing the property. They were not responsible for the acts of their predecessors, as the accompanying extract from the London *Mining Journal* of the proceedings of a shareholder's meeting, held on the 17th of August last, will sufficiently explain.

A perusal of the minutes will put you in possession of the facts, and enahle you to remove from the mind of your correspondent the erroneous impression which has beeu somehow created.

The £2,000 referred to, was, in addition to his former contributions, advanced by Lord Poulett, the Chairman of the preseut Board.

Vice Chancellor Malin's special idiosyncracy seems to he, that noblemen aud gentlemen should not be directors of public companies. Happily, the direction of the Imperial Company is, notwithstanding his Lordship's views, composed of just such men as are required to give stability and confidence to such an undertaking as the Imperial Silver Qnarries Company in England, where capitalists are somewhat prejudiced against American mining.

Your ohedient servant.

LEWIS CHALMERS,
Manager at the mines.

Monitor, Alpine Co., Jan. 15th, 1869.

[The proceedings referred to were given in full at the time, in the London *Mining Journal;* and though some ill-feeling had evidently been created, it appears that our correspondent's representations above, are suhstantially correct.—EDS. PRESS.]

THE "CALIFORNIA SOCIETY OF ARCHITECTS" has just heen organized at the Mechanics' Institute, by the election as President of Caleb Hyatt; Vice-President, David Farquharson; Corresponding Secretary, Wm. Putnam; Recording Secretary, W. H. Williams; Treasurer, S. H. Williams. At a meeting held on Jan. 10th, twenty-three members were present. It is proposed that essays and papers on architectnral and huilding subjects shall he read, and lectures delivered for the henefit of the society, from time to time. By creating amongst architects themselves an intelligent "public opinion," and cultivatug good tastethrough a free comparison and discussion of their hest conceptions before venturing to inflict unsightly realities upon the future of San Francisco,—such a society promises to he a thing of real henefit, at the same time that its vigorous existeuce will stand as an evidence of the intelligence of the professiou.

PHILOSOPHICAL AND CHEMICAL APPARATUS.—Prof. R. A. Fisher, of the State University, has heen authorized to expend $10,000 for the purchase of chemical and philosophical apparatus for that institutiou.

PRESENTATION OF MECHANICS' INSTITUTE MEDALS.—The gold and silver medals awarded hy the committees at the late Fair, were presented on Saturday evening last, and the managers themselves were the recipients, for their "powers of endurance" and "tenacity," of a sole leather medal which measured two feet in diameter. We append additional list of awards of medals, to those already published (to he found on page 184, Vol. XVII):

John Roach—Solar transit and compass, inventors' gold medal.

Gold Medals.—Elam & Howes—California made wooden ware. Califoruia Powder Works—best California made powder.

Silver Medals.—Dietrick & Eckart—Oscillating steam engine. Ætna Iron Works—Bemis's patent grate bars. I. H. Small—Improved planing machine. T. F. Mitchell—California made blocks. Capt. George Cummings—Model of clipper ship "Young America." Dr. A. Folleau — Orthopædic instruments. California Wine Cooperage Co.—Wine casks. Bryant & Strahan—A carved sidehoard. Pacific Powder Mills—Superior California made powder. P. J. Devine—Marhle bust. P. Mezzara—California cameos. O. A. Olmstead—Mineral paints. San Francisco Candle Co.—Adamantine candles. C. E. Watkins—Best collection of photographic viewe. Silas Selleck—Best plain photographs. H. W. Vaughan—Best collection of colored photographs. Mrs. T. J. Winship—Best display of millinery. Wm. Cantelow—Best foreign varieties of grapes.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK:

On the **6th, 14th, 22d** and **30th** of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French steamer for the Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR JANUARY, 1869.

The following Steamships will be dispatched on dates as given below:

January 6th—SACRAMENTO. .....Capt. W. H Parker, Connecting with ALASKA, Capt Gray

January 14th—MONTANA. .....Captain A. We Connecting with RISING STAR, Capt. King.

January 22d—CONSTITUTION. .....Capt. Wm. H. Hudson Connecting with HENRY CHAUNCEY, Capt. Connor.

January 30th—GOLDEN CITY.....Capt. W. F. Lapidge, Connecting with ARIZONA, Capt Maury.

Cabin passengers berthed through. Saggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched on MONDAY, January 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Enterprises and Developments.

THE fields in the vicinity of Sacramento are white with mushrooms.

A BOOT AND SHOE factory is to be started at San José.

THE five grist mills of Napa County gronnd 31,000 barrels of flour last year.

THERE are now near Boise City, (I. T.) two distilleries and three flonring mills in constant operation.

THE paper mills at Watsonville are manufacturing ninety reams of paper per day.

FORTY tons of California mustard seed were shipped for New York by the *Golden Age* on her last trip.

The woolen mill at Ashland, Trinity county, is now in successful operation, running 240 spindles.

THE manufacturing dam and canal of the Natoma Water and Mining Co., Folsom, will be fully completed during the coming spring

PETROLEUM IN KERN COUNTY.—The petrolenm works of the Buena Vista Petroleum Co. in Keru County, are now manufacturing excellent oil, both for burning and lubricating.

FRED. HOLZINGER, of Folsom, has proved this season that hops can he raised in the foothills successfully, and with profit. He has raised a large crop, the hops heing larger than those known to the valley.

PETROLEUM IN MEXICO.—A company has been formed to explore the ahnndant coal oil wells of Buerta de Los Angeles, in the State of Oajaca, Mexico. The consumptiou of coal oil has increased considerably throughout Mexico.

LIME ROCK.—Edward Allen, of Hope Valley, Alpine County, has discovered a body of marhle which will make as fine lime as that from Marble Valley. This is an important discovery for that section, when "the county comes out," says the *Chranicle*,

ARTESIAN WELLS on the Dominquez grant, between Los Angeles and Wilmington, flow thousands of gallons of good, soft water daily upon the wild mustard plains, and it is expected that the land heretofore barren comparatively, will he speedily covered with vineyards and orange groves, and he worth $100 an acre.

MINERAL SOAP.—The Secretary of the Califoruia Pioneers has on exhibition a quantity of "mineral soap," which is said to resemhle the gray sulphuret of silver. A piece of it, used with water to wash the hands, produces a lather like good toilet soap, and it is said to exist in great abundance in Sonoma County, where a well defined vein has been found. The locality is kept secret hy Mr. H. B. Osgood, its discoverer.

C. F. REED will hatch about 100 ounces of silkworm eggs this year, aud I. N. Hoag and W. M. Haynie each from 200 to 300 ounces. As there are at least 30,000 eggs to an ounce, this would give 18,000,000 cocoons. Some of the silkmen of Los Angeles say that county will produce 20,000,000. Santa Barhara and Santa Clara together must have nearly or quite 1,000,000; making 39,000,000 cocoons for the year; and for these the State would have to pay $117,000 premiums. If these cocoons are all hatched, they will produce 190,000 ounces of eggs, which, at $5 per ounce (they are now worth $12) will sell at $900,000.

MINING AND SCIENTIFIC PRESS,—We look upon thia papei as one of our most valuahla exchunges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and coutains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, ahould be patronized by every one, but more especially by miners, mechanica and inventors who wish to pursue their avocationa with intelligence and economy.—*Tidal Wave, Idaho.*

Patent Brokerage.

PATENT RIGHTS

Bought and Sold on Commission.

A variety of new and valuable Patents for sale, novel and useful articles, suitable for TRAVELING AGENTS, always on hand, among which are the following:

Patent Cigarette Roller, and patent gummed Wrappers for the same. Every one can make their own Cigarettes. Price $2.50 (including 400 wrappers.)

Wilson's Patent Solder, for mending tin ware without soldering iron, prepared for family use. Retail price 50 cents.

Elliptic Steel Scrapers, for cleaning boiler tubes (all sizes)—best thing ever invented for the purpose. Retail prices from $8 to $10.

AGENTS WANTED.

THE CELEBRATED

IMITATION GOLD

$15. Hunting Watches. $20

CASES OF THE COLLINS METAL (IMPROVED OROIDE)

Special Notice.—Our superior Oroide Watches having recently been imitated, and worthless watches sold in New York, Boston, Chicago, and other cities, represented as our watches, we hereby caution the public against them, and give notice that we are in no way responsible for these bogus concerns, and only those purchasing directly from us can secure a genuine Watch of our manufacture. We have recently greatly improved our Oroide in appearance and durability, and, to protect the public from imposition hereafter, have named it the "COLLINS METAL," and we give notice that any one making use of this name will be prosecuted to the extent of the law.

This metal has all the brilliancy and durability of gold; cannot be distinguished from it by the best judges; retains its color till worn out, and is equal to gold excepting in intrinsic value. All our Gentlemen's Watches are *Full Jeweled Patent Levers*; those for Ladies an improved Escapement, better than a lever for a small Watch; all in Hunting Cases, and fully guaranteed by special certificate. The $15 Watches are equal in neatness, style of finish, general appearance, and for time, to a gold one costing $150. Those for $20 are of *extra* fine finish, and are fully equal to a Gold Watch costing $200. Chains of every style, from $2 to $6. A so, Jewelry of the Collins Metal in every style.

To Clubs, where six Watches are ordered at one time, we send ONE EXTRA free of charge. All our prices are in Currency.

Goods sent to any part o the United States by express, to be paid for on delivery. Money need not be sent with the order, as bills can be paid when goods are taken from the express office. Customers must pay all express charges. We employ no agents; orders must therefore be sent directly to us. Customers in the city will remember that our *only Office* is

Nos. 37 and 39 Nassau street, New York,

Opposite the Post Office, (up stairs.)

C. E. COLLINS & CO.

Citizens of Toronto and the Dominion generally, take notice. We have hundreds of testimonials. But you need no further evidence than the following from one who is well knowu among you. Here is his proof positive.

Harry Hazleton, the well known author, says:

"I have always looked upon cheap watches as humbugs, and dealers in them as little better than swindlers. At the request of a friend, I have worn for three months, the watch he purchased of C. E. Collins, and for which he paid $15. It accurate time, retains its perfect golden appearance, and I can really see no difference between it and my own, which cost five times the amount of the Collins Watch."

Mr. Hazelton adds:

"I have since purchased FIVE of these watches, at the request of friends, and those for whom they were intended are perfectly satisfied. Others are seeking for them, and I fancy that Mr. C. will find some difficulty in supplying the constantly increasing demand."

☞The regular price of the watch is $15, and others costing $20. These are superbly finished, and really superior to any article placed upon the market, costing five times that sum.

Office State Capital Reporter, 42 and 44 J street, Sacramento, Cal., July 15, 1868:

C. E. COLLINS & Co.—Gentlemen:—Wells, Fargo & Co. delivered Watch and Chain, as per order, paid bill on presentation. The Watch and Chain give entire satisfaction, and several of my friends wish the same quality of watch and chain. One is chief editor of this paper, and two others are the publishers of this paper, and the others are for friends of mine, and by wearing your goods will make you a large sale in this city. I therefore wish you to send me seven watches and seven chains, of same quality as those you sent me, price paid you $15 for watch, and $6 currency for chain. I return you the guarantee, it may assist you in ascertaining the exact kind of goods sent me, the number of the watch sent is 66,982. If this order sent turns out as satisfactory as the first, we will give you a good editorial notice, and help you along as far as practicable. I send this order not for my benefit, but for yours and to accommodate my friends. Send to E. K. Phipps, office of "State Capital Reporter, Sacramento, California."

Yours, respectfully,

E. K. PHIPPS.

Address,

C. E. COLLINS & CO.,

37 and 39 Nassau street, New York.

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

New Mining Advertisements.

Rattlesnake Mining Company, Brown's Valley, Yuba County, California.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, the thirtieth day of January, 1869, at the same hour and place. By order of the Board of Trustees.

jan9 ENOS TAYLOR, Secretary.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

Job Grinding and Polishing by steam. Orders from the Country promptly attended to. ☞ All work warranted. Prices reasonable.
21v17-qy **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches range from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. H., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Portable Engines.

The Swamscot Co's (warranted equal to any manufactured, may be seen in use in this city), PORTABLE and STATIONARY STEAM FIRE ENGINES, STEAM PUMPS and ROTARY PUMPS, and WOOD-WORKING MACHINERY of every description, at Eastern prices. Address W. O. M. BERRY & CO., 511 California street, San Francisco.
25v17-3m

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and language; is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send in their, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Montgomery Block. Prompt action is necessary.

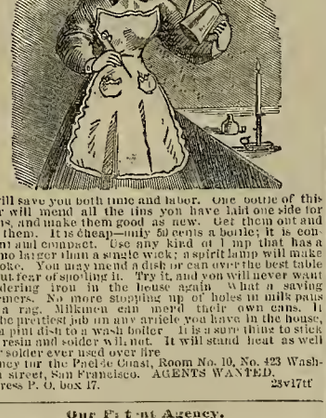
Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.



It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.
Address P. O. box 17. 23v17tf

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

[Written for the Mining and Scientific Press.

Gold Mountain District, Nevada.

This district is situated about thirty-five miles south, twenty-six east, from Silver Peak, and within twelve to fifteen miles of the southwestern line of the State. It is 175 miles due south of Austin, and hence must be within the southwest corner of Nye County.

The mines of the district can be easily approached by good natural roads from Silver Peak, Belmont, or Palmetto, and thence through good valley roads to any point on the Pacific Railroad from Wadsworth to Gravelly Ford, on the Upper Humboldt.

The district is bounded on the west by a high ridge or mountain called "Mount McGruder," on the south by an east and west range of barren and broken mountains composed mainly of granite, porphyry and lava, on the east by irregular, detached and broken ranges of granite, slate, volcanic hills and desert plains, and on the north by granite hills and a large valley having a slope to the northeast, then east to the Armagossa flats or meadows. The district as at present organized is twenty miles square, the lines being conformable to the cardinal points of the compass.

The principal lode or vein is situated near the center of the district in the southern side of a low range of mountains that extend from the east base of Mt. McGruder, eastward across the district, where it unites with the desert mountains that extend southeasterly towards Death's Valley. On the southern slope of this cross range of hills (forming the central feature of the district) is a belt of slate from one-fourth to one-half of a mile wide. This slate belt or zone gradually narrows towards the west, and blends into or terminates in the granite formation, a few hundred yards west of the principal lode or vein, called by the discoverers the "State Line Lode." Hornblendic, micaceous and silicious slates, with occasional beds of calcareous sandstone and impure granular limestone, compose this belt of slaty rocks. Some of the surrounding granite hills show lines of bedding or stratification like gneiss; but the general character of the granite is fissile and friable, without any well marked evidences of stratification.

THE STATE LINE LODE.

This vein is situated in the west end of the belt of slate above described, near its junction with the granite. The strike or course is south 65° east (magnetic) and the "underlie" is 29° northeast of the vertical line (or as it is commonly expressed, its *dip* is to the northeast, at an angle of 61°.)

The walls of the vein are well marked and clearly defined by interveuing clay seams, that show distinct lines of movement, indicating the "pitch" of the rich quartz to be about 25° east of the perpendicular line. (As a general fact these lines of motion indicated by grooves and scratches upon the walls, are parallel with the line of richest deposits.) The thickness of the vein is variable from eight to twelve feet measured perpendicular to its walls, and the outcrop extends in length about 1,500 feet without any intermission or break, but is traceable as a smaller sized vein at least 1,000 feet further west of the principal body of the outcrop. Easterly the vein disappears under the debris and "wash" from the mountain above, and has not been explored, therefore its extent longitudinally in that direction is not known.

The lode is composed mainly of a friable, granular quartz, more or less stained with the oxides of iron and manganese, and in the richest portions with phosphate and oxide of lead slightly. Simple sulphide and oxide of iron largely predominates over all other minerals or metals apart from the free gold it contains. Several hundred feet of the southeast end of the large outcrop is so completely friable that the entire mass can be removed without blasting. The gold is disseminated in fine, roundish particles, pretty well through the mass of the vein, but there appears to be two bands or zones of quartz that are richer in gold than the general mass. One is near the foot wall, and found to be from one to two feet thick. The other commences near the center of the vein, and includes most of the upper half,

to the hanging wall. The remainder of the lode is low grade quartz, carrying from $5 to $15 per ton. Many assays and working tests have been made on a small scale that give very promising results. One thousand pounds of the quartz taken from the richest belts of the veins has been worked in a mill at Belmont. The yield was at the rate of $176 per ton. This lot of quartz was not closely assorted from the richest portions, but was intended to represent fairly about three feet of the lode at the point where it was taken out. So far as the explorations extend (800 feet in length) the facts seem to bear out the statement that at least one-half of the vein will give $20 and upwards per ton. Many tons of quartz now in sight on the croppings will give over $60 per ton in free gold, by the ordinary milling processes now in use in California.

THE CLIMATE

in the southern portions of the State of Nevada is very favorable for mining operations. The snow rarely falls on the valleys at all, and not exceeding one to two feet deep on the high ranges of mountains. In the summer time heavy thunder showers are common in July and August, confined mostly to the higher peaks and ridges of the mountains.

As a stock country, "Gold Mountain District" is rarely surpassed anywhere on the Pacific Coast. Cattle, horses, and sheep will keep fat the entire year on the nutricious bunch grasses, and the "white sage," of which they are very fond.

The State Line lode is a true gold mine, and not at all likely to change into a silver bearing lode like those at Gold Hill, and others of similar character.

The slate inclosing the vein belongs to the lower silurian—possibly the Taconic period preceding the Silurian. No trace of fossils—or any kind of organic life has yet been found in the gold-bearing slates of Southern Nevada. The best pronounced gold mines in this part of the State, is found in the granite and the slates immediately overlying it. Slates here of a more recent date are apt to carry gold and silver, together with more or less copper and lead, and the crystalline limestone above the slates rarely carry any gold, but rich deposits of silver, copper and lead are found. This appears to be the order in which the metals are associated with the rock formations of Silver Peak, Palmette and Gold Mountain districts.

The value per ounce of the gold from the State Line lode is $18.50. The gold from Red Mountain near Silver Peak is worth $14.50 per ounce. J. E. CLAYTON.

Gold Monntain, Nev., Sept. 25th, 1868.

CULTIVATING THE SAGE BRUSH COUNTRY. It is by no means improbable that in a short time large stretches of sage lands in Nevada, than which nothing more dreary can be imagined, so far as appearance goes, and which have so long served only to point jests against the Silver State, will also be utilized. The Humboldt *Register*, speaking on this subject, says: F. A. Shaw, of Grass Valley, in that State, sowed twenty-five acres of barley last spring, on white sage land, with the following results: Finished sowing May 15th; total yield of barley when harvested, 64,000 pounds. Also sowed four acres of wheat which yielded forty bushels to the acre. The ground was partially irrigated, but Mr. Shaw says he is certain a good crop can be raised without it. In confirmation of this belief he says he has seen barley mature in all kinds of places where it had fallen and come up, without irrigation. There are millions of sage brush or artemesia lands in the great basin which have been regarded as valueless, yet which may prove to be largely productive. Gov. Stanford proposes to make a trial of the lands of the great Humboldt desert, adjoining the line of the Central Pacific Railroad. He is of the opinion that the alkali with which the soil of that region is impregnated will enrich rather than improve such cereals.

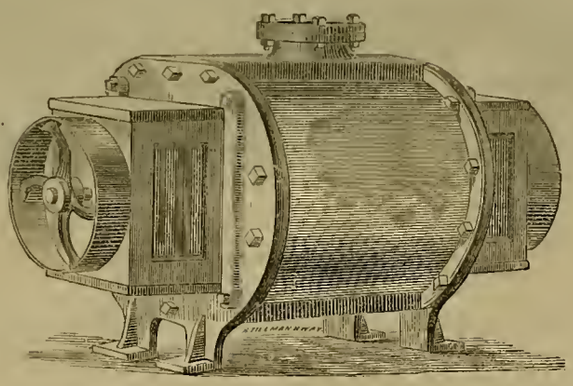
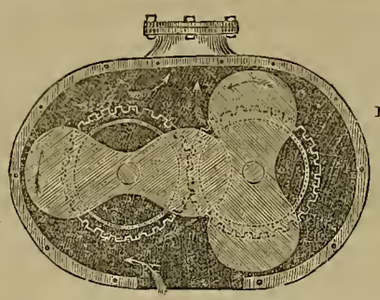
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

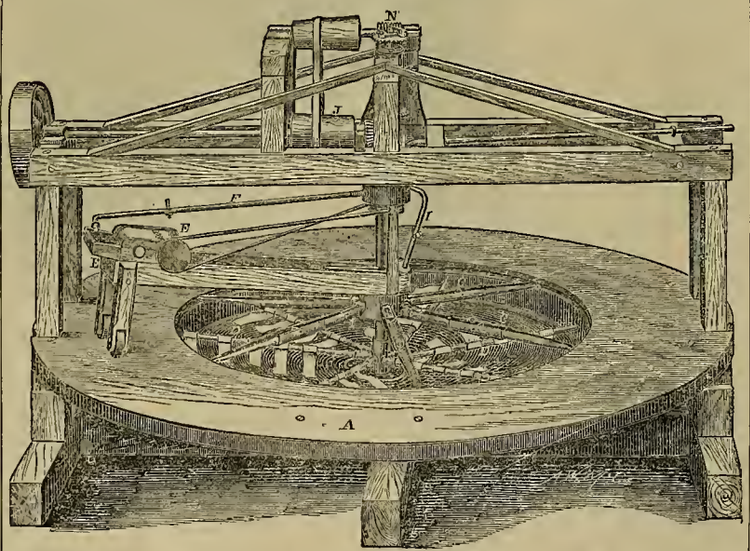
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps.

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFICATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

A WARNING
TO ALL WHO ARE AFFLICTED.

Before the rainy season comes get cured of Rheumatism and Neuralgia, by herbs only. The receipt was given some years ago by an old Indian in New Orleans, and it has never failed to cure all it says. Many have been cured in this city and in Boston, and all say it is the best they have tried. Manufactured by MRS. MARY HIGGINS, Oregon street, two doors west of Drumm. Orders sent by mail or express attended to on receipt of $5 per bottle. 22v17-3m

[Written for the Mining and Scientific Press.]

N. Y. Society of Practical Engineering.

The New York Society of Practical Engineering beld a regnlar meeting at their room, No. 24 Cooper Institute, New York city, on Tuesday gvening, Dec. 22d, James A. Whitney, presiding.

The subject regularly before the meeting was "The Prevention of Marine Disasters," and a paper thereon was read by Mr. C. Williams, C. E., of New York city.

The writer treated at length of the different causes of disasters at sea and upon inland waters. For the prevention of burning, he recommended snch treatment of the timbers employed in ship-building as would render them incombustible, and among other methods of securing this result, mentioned that invented some years ago in England and known as the kyanizing process. This, consisting simply in impregnating the wood with snlpbate of iron, not only renders it measurably fire-proof, but makes it impenetrable to marine insects, and also iusures its greatly increased durability. The author also recommended the more extensive employment of steam pumps, especially upon sailing vessels, both as a means of preventing foundering from leaks, but also as enabling fires to be readily subdned. With reference to vessels wrecked either upon reefs or coasts, or in mid ocean, he sketched the general outlines of construction of a storm-proof raft, designed to facilitate and insure the escape of passengers and crew.

During an active and interesting discussion following the paper, Dr. Parmelee explained tbe practical difficulties that would be found to exist in rendering wood perfectly fire-proof, and stated that in his opinion the so-called fire-proof paints were of little worth, inasmuch as the shrinking and splitting of the wood when heated, would expose its interior, and this last would of course ignite.

Lawrence Holt agreed with Dr. Parmelee as to the non-availability of fire-proof paints, but thought that wood might be rendered fire-proof by impregnation witb mineral matter injected into the pores by means of an apparatus involving the use of a vacuum, in such manner that the mineral might be injected into the wood by the pressure of the atmosphere.

J. V. C. Hall, explained tbe construction of a bulkhead designed for steamers navigating the western waters wbere "snagging" is of common occnrrence. This bulkhead is so arranged that even if the low or forward portion of the boat is stove by running against a "snag," the hull would still remain buoyant, and no danger to life or cargo would be incurred.

The Society adjourned for two weeks, after the announcement that at tbe next meeting the subject of "Concrete, its uses and Application in Building," would be taken up for consideration.

Salt Lake on Carmen Island.—Gardiner F. Williams, M. E., has just returned from a trip to Carmen Island, where he has been examining a small salt lake, witb a view to determining the feasibility of draining the same, for the production of that article of permanent commercial demand. Tbe work proposed is in the interest of Holladay & Brenham.

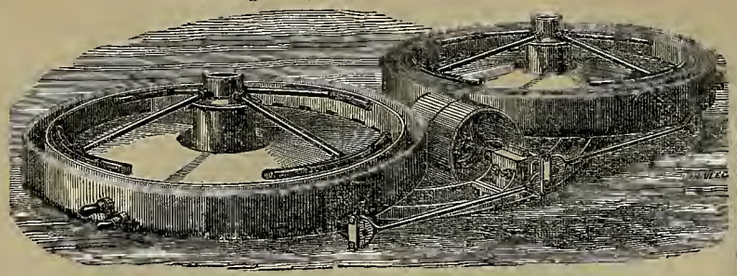
Car Building.—The car stock for a new horse railroad in this city, starting from the Masonic Temple, and leading through Post, Market, Mission streets, etc., out to the Harvey Brown tract, is being turned out as fast as possible at Casebolt's carriage factory; the cars being sixteen feet long—the largest in the city. The road is to be in operation in May.

The surface of the warm springs near Carson, Nev., has suddenly sunk two feet.

Mining and Scientific Press.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Snlphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as tbat for the separation of sulphurets. Many machines have heen tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with whicb his name is already so familiar.

RECOMMENDATIONS:

San Francisco, October 19th, 1868.

Mr. M. Hungerford—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work tboroughly and effectively. At a recent clean-up of four ot them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton ou the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

Office of the Oneida Mining Company, Jackson, May 13th 1868

Mr. Morgan Hungerforn—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lamhard last month, I will say that I put them up in the Oneida Mill soon after I arrived bere, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I bave used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

Big Oak Flat, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, wbich will be forwarded to any party wbo may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried tbat. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and bis name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured hy Gonnard & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

Tbese Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

USING THE TIDES TO MAKE COMPRESSED AIR.—It is said that there is power enough in the rise and fall of the tides, to drive all the machinery that man would ever have occasion to use. Yet so far as we are aware, no advantage has been taken of this fact, except in the old-fashioned tide mills, where the wheel is stationary, either on shore or on an anchored boat, such as one may see in great flotillas, whitened with flour, or green with moss, on the Rhine. Mr. N. B. Adams, the representative of several very ingenious inventions at the late Mechanics' Institute Fair, suggests that compressed air power might be obtained by the use of a great iron, gasometer-shaped vessel, to confine the air between high and low tide, by fastening the vessel to the bottom; so that when the tide rises, for example, the air in the vessel above would be compressed precisely as is found in shoving an inverted tumbler containing air, some distance under water. The amount of compression would correspond with the hight of the column of water outside. A pipe leading from the top of the air reservoir would conduct the elastic element to any point where the power might be required for use. When the tide falls, the same force would be exerted in the reverse direction, to prevent the formation of a vacuum in the reservoir, the pressure in this case being limited by the weight of the atmosphere.

In this manner there is no doubt a kind of compressed air engine on the principle of the windmill, could be driven by suction, and counter suction, through the conducting pipe; but as the force would not increase in proportion to the area of the water inclosed by the reservoir or gasometer, the working effect would depend upon the volume of partially compressed air, in proportion to the size of the pipe. That is a problem in natural philosophy which we would recommend the reader to calculate out for his own satisfaction.

MINERS' MEETING AT COLFAX.—C. C. Brogan, J. B. Taylor and S. D. Moore, Miners' Committee, request that a meeting of the several mining precincts of Nevada and Placer counties be held at Colfax, Feb. 4th, to take action in the case now pending before the courts of this State, wherein Williams is plaintiff, holding title from the Central Pacific Railroad, and Parber and other defendants.

City Horse Railroads and the Coupon Ticket Nipper.

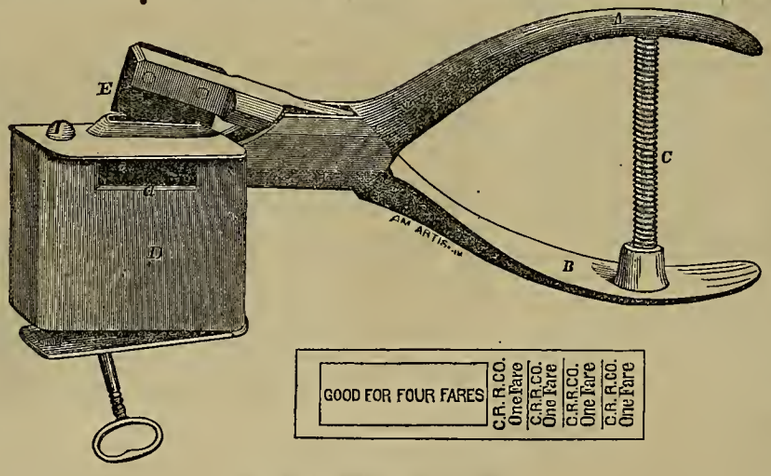
The adoption of the convenient snuffer-like "coupon ticket nipper," shown in the engraving, now as familiar to San Franciscans as the sight of a street railroad car itself, being a California invention, the product of the ingenuity of Mr. Robert J. Kellett, of this city, has worked so advantageously, even upon city railroad stocks, and has been the means of bringing about such noteworthy conveniences to railroad passengers in the system of exchanging tickets which has obtained through its agency between different lines, that a particular mention is deserved of some of the points in railroad economy touching its use, while at the same time we embrace the opportunity of referring to street railroad operations in general.

We are informed by the inventor of the coupon ticket nipper that the street railroad stocks in San Francisco have increased in value a third since its adoption, the city railroads being, without a single exception, now in a very healthy condition. That even a fraction of this advance can be due to the adoption of a ticket system whereby peculation on the part of conductors and agents is rendered impossible, comments strangely upon human nature and upon street railroad management. The receipts of the companies certainly show an increase, and it is said that conductors—poorly paid no doubt—have been heard to complain that under this system they are not able to make anything more than their salary of $2.50 a day. The conductor is now responsible to the company for the number of tickets he takes; and while he gives a kind of receipt to the passenger for every fare he collects in returning the body of the ticket, he retains in the coupon-nipper a check evidencing the amounts, the same being of no further use to him, as he is not able to sell the coupons, like tickets, over again, and mainly of use in showing, by the color of coupon, the number of fares that have been had on tickets sold by other companies. These conpons are strung on strings in the railroad offices, counted, and settled for monthly; the money going, in the end, not to the company that sells the most tickets, but to the one that nips the largest number of coupons; an even exchange being made between all the companies.

Scores of inventions for the prevention of peculation under similar circumstances, have been tried and found more or less ineffective. The present system is coming into general use, not only on Eastern horse railroads, but wherever exchanges between steamboats and railroads are found to be a convenience to the public.

Perhaps the chief value of street railroads is the enhancement effected by them of the value of suburban property. The several Mission railroads, and the Turk street railroad to Lone Mountain, afford the most striking evidences of the importance of this fact. At the same time it is evident that increased speed and facility in transportation would operate still more favorably than the present very defective means have done. Statistics of the several street railroads in San Francisco, given in a very full article in the *Bulletin* of Jan. 26th, show the value of street railroads from the dividends that are returned; as an example of which it may be stated that the Omnibus R. R. Co. carries 275,000 passengers per month, and receives for fares $223,659 per year.

Many problems are suggested to the inventor, by the operations and the demands of street railroads. To prevent crowding; rattling; using up and brutally treating horses, whose torturously clattering slipping hoofs on the cobbles, and whose woful-looking eyes and anatomy, are painful to the unwilling observer; while the harsh metallic clatter of the rails, and the filthy or damp interior of the cars, afford cause for a just aversion to the city railroads as an institution. Slowness of travel, from frequent and irregular stopping, involving a dead loss of power far greater than that which would make the car travel over its entire route, is a difficulty with street cars which has called forth seventy-five different inventions,—motive powers, car starters, etc.,—some of which, properly modified, will probably, in time, supersede present systems. For long, unbroken distances, the dummy engine cars at New York, carrying three-horse loads, have proved a success; and the elevated railway on Greenwich street, in that city, will shortly be heard from under the test of practical operation, the two doubtful points in regard to it being the frightening of horses at street crossings, and the unpleasant noises made overhead by the iron running gear. Tanks for compressed air or steam are proposed for motive power, in lieu of horses, but do not appear to have been satisfactorily tried. Another important problem is the establishment of successful city railroads on steep grades. Where the rewards of ingenuity are great, and the solving of a mechanical problem is at the same time a marked public benefit, the issue can be only one of application, and of time.



KELLETT'S COUPON TICKET NIPPER.

HOWLAND'S CIRCULAR STAMP MILL.—A new circular eight-stamp mill, of the kind which has been at work since 1861 at Gold Hill,—but embracing many improvements,—has just been completed at the Miners' Foundry, for Mr. A. Staples' mill at White Pine, and will be set in operation for the first time to-day. Though criticised somewhat at the time of its original production, the circular stamp mill seems to have been giving satisfaction, and to be making its own way into use. Its merits are its compactness; completeness without extra fixtures; durability, and in requiring, as is claimed, only 5-horse power where an ordinary 8-stamp mill would require 12-horse power. While it does not do more work than any other 8-stamp mill, it is claimed that the work done is better, the principal reason for which is the greatly enlarged screen surface forming the outer circumference of the mill. It weighs five tons, while an ordinary mill weighs eight tons; costs $1,600, and does not require any wood work, or millwrighting, to put it into operation. Once on the ground, a few men can put it in running order in a day or two. This saving, including the three tons less freight, will, it is claimed, reduce its actual price to half the cost of an ordinary mill. The quartz feeds in at the center; and the stamps are raised, and dropped two at a time, by a single shaft, connected by bevel gear with a large pulley. The diameter of the octagonal part is four feet three inches; of the round part, forty inches; hight, eight feet. The weight of the stamps is variable; in the present machine they are 600 pounds.

MR. HARFORD, the Curator of Conchology, is engaged in arranging systematically the shells belonging to the Academy of Sciences. There are prospects of the same being done in the Geological and Mineralogical departments in due time, which will add greatly to the value of the Academy of Sciences as an institution.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Account of Famous Mines in Mexico.

Batopilas, Chihuahua, Mex., Oct. 24th, 1868.

[Continued from page 50.]

THE ST. DOMINGO MINE

is known to give among its very rich ores a fair percentage of ruby silver, sometimes in large masses, and the most beautiful crystals.

THE DESCUBRIDORA

claim lies to the south of the town, almost at the top of a very high mountain, and contains some sixteen or eigbteen lodes. Some five years ago it was sold by its tbeu owner, Don Francisco Vinićgra, to an American company from San Francisco, which worked it for a little while, but failed to prosecute it, and finally lost it again by letting the lawful term of holdiug it as property run out. It then reverted back to its original proprieter, who now draws very rich returns from it. The claim has in former times given several great honanzas, and can be very conveniently worked by a tunnel. In none of the lodes are the works said to go deeper than sixty yards.

THE MARTINEZ CLAIM,

on the *Animas Hill*, comprises some of the very best mines, prominently among which are the *Martinez, Vallinas, Vaooa*, and *San Pedro*. The first one has given many millions to its former owner, the Marquez of Bustamante, and is said to he left in metal in some of its workings. The *San Pedro* in little more than fifty yards deep, gave several hundreds of thonsands to Don Juan Mendazona, and shows most flattering prospects. The claim is now heing worked hy an American Company, who are actually engaged in driving a tunnel to go under the old workings of the Martinez, and another one under those of the Vallinas mine.

THE CATA MINE

helongs to Mr. G. Le Brun, who, bowever, confined his workings exclusively to the Pastrana. It is one of the most important and promising mines of the district, which has given millions of dollars, part of it in silver so massive tbat it had to be chiseled out.

I might continue giving the outlines of many not less productive mines, dozens of which have given hundreds of thousands of dollars in comparatively very insignificant workings, the most of them averaging only thirty yards in depth; hut the foregoing ones have, I think, sufficiently proved the uncomparable value of the distriet, if we do not lose sight of the fact, that all these mines and lodes are, so to say, as yet almost virgin, not a single one having heen explored over 150 yards down from the surface, and when we hear in mind that the tunnels of the Pastrana and of San Miguel give evidence that the mineral deposits go down to the unknown depths, allowing for barren intervals.

I will only mention yet another enterprise, which in these very days, has heen started by a gentleman of whom I have already had occasion to speak, Mr. H. Stearns; an enterprise which bids fair in its glorious prospects and final resnlts to leave behind any otbers of which I bave heard, or which to my knowledge exists on our continent. The plan of it was conceived by Mr. Stearns years ago, and he has ever since untiringly worked to accomplish it. This great undertaking consists in nothing less than to drive a

TUNNEL THROUGH THE ANIMAS HILL

for a distance of about 1¼ English miles. This bill may, without exaggeration, be termed a colossal bed of silver.

The number of lodes which have formerly, or are at present worked in it, may go over 100, many of which having given great bonanzas, or are now turning out the richest kind of silver, many hundreds of feet above where this tunnel is to cut them. Besides these, several hundred veins lay between them, which have never been touched yet, or to a very limited extent only at their surfaces, hut may turn out equally rich. Hardly anywhere more than fifteen yards will intervene between any two of them, in many points not over ten. The mineral country throughout this hill is of the very first order, and increasing in richness below, promising incalculahle wealth.

Among the famed lodes which in its course this tunnel is destined to cut, are the Nevada, San Antonio Ohiquito, St. Theresa, Anrora, Vallinas, Martinez, San Pedro, Pastrana, and Arbitrios. This latter one having once formed one of the most prominent ones in the district, lies as the very last and highest, where the Animas Hill joins another hill. After having lain abandoned for many years, a San Francisco Company started in to work it anew a few years ago, but striking a horse in a new work above, of some sixty yards in depth, broke off here to drive in the old works helow to get under them. The country did not prove good as expected, hut was improving, and a considerahle gallery with upper works driven to within a few yards from a main cross lode, where the former great houanza was known to have lain, when the company stopped work.

The lawful term baving expired, Mr. Stearns claimed the mine as the end-point of his tunnel, with the object of draining it thereby. The time necessary to drive it through, Mr. Stearns calculates at about eight to ten years. He has already set energetically to work, after procuring full and undisputed documcuts of possession for his valuable property, and opened his work directly opposite the mouth of the tunnel of the San Miguel, on the other side of the river. About seventeeu yards have been driven, and a small vein has heen cut, which shows good prospects; the first one in importance, however, will he the Nevada, in about twenty yards distance; thence vein after vein will follow.

The people here are perfectly wild about this enterprise, and all those acquainted with the geological and mineralogical features of the district, predict for it a success of the most astonishing dimensions. Everyhody is congratulating Mr. Stearns on his hr.lliant prospects and acquisition. For, even allowing the most improhable case, that ont of these several hundreds of lodes only one or two dozen should he out in silver, which, as the experience of this hill shows, consists principally in pure metallic silver, or the very richest sulphurets, the result must go up to many millions.

I am very sorry that I have not personally met Mr. Stearns, as he had left B. a few days hefore my arrival here, going on to New York, I uuderstand, hut leaving an agent here to prosecute the work vigoronsly during his absence.

My time of stay here in Batopilas is nearly up now. I shall likely leave next week for the neighhoring mineral district of Urique, whence I shall write to you again, and describe what I see.

Yours respectfully, Minero.

The Giant Powder Comparative Figures.

San Francisco, Jan. 25th, 1869.

Editors Press :—Noticing in your paper of 16th inst., a communieation having reference to the nse of Giant powder in the Oakes & Reese mine, belonging to Mr. McAllister and myself, I heg to state that duriug the past week our superintendent, Mr. Cassel, has let the following contracts, for work in the mine :

1—Sinking main shaft 50 feet from the 278-foot level, at $60 per foot—contracting parties furnishing everything.

2—Drift west, on Oakes & Reese vein, 50 feet, at $13 per foot—contractors furnishing everything.

3 - Drift South, on Blue Lead, 50 feet, at $10.75 per foot—contractors furnishing everything.

The samc work has heretofore cost us, with nse of black powder, as follows :

1—Sinking main shaft, $90 per foot.

2—Drift west, Oakes & Reese veiu, $35 per foot.

3—Drift south, Blue Lead, $25 per foot.

Thus it will be seen that in these three contracts, the mine owners save as follows:

1. Sinking 50-foot shaft, at $30	$1,500.00
2. West drift, 50 feet, at $17	850.00
3. South drift, 50 feet, at $14.25	712.50
Total saving	$3,062.50

In addition to the saviug, in dollars and cents, is also the important item of saving in time, as the time occupied in finishing the contracts with Giant powder is only about one-half of the time required with use of ordinary powder.

The contractors, even at these low rates, are better satisfied with the prices, than under the old prices with the common powder.

Very rcspectfully,

L. L. Robinson.

Hydraulic Mining in Placer County. Velocipedes.

Dutch Flat, Jan. 20th, 1869.

Editors Press :—Since my last letter to you, the Baker Boys' mill has made a run on tbeir claims in the Blue Lead, and had a clean up, which demonstrates beyond further doubt the richness of the under or Blue Lead at this place. All we want now is energy and capital to make these diggings yield at '49 rates.

The hydraulic claims, too numerous to name individually, are nearly all running with good profits to the owners. The Buckeye Company have gone hack and started on the bedrock, some hundred and seventy feet lower than any other company upon the north side of the hill, and have found some immensely rich streaks of dirt. Wheu they have completed their fitting up, and made their first run, I will inform you of the exact amounts; and I am sure you will say that with the same investment in the mines in this State, as good results may be had as in any mining section known. This is not an isolated case, or mine of rich deposit in this section, but I speak of it more particularly, because they have gone to the lowest depth or bedrock to work with hydraulic rigging, as many others will do when they see the results of these operations. Mr. Chesbire, a man wbo has worked at mining all his life nearly, is engineering the work. He knows how to work mines for what they are worth, and has recently hought out several of the partners.

QUARTZ.

The Champion, Rhode Island, and Watereе quartz lodes are showing fine rock, considerahle free gold and heavily sulphureted. These lodes are ahout ten miles above this place.

VELOCIPEDES.

Now if you will permit, I will change the subject to mechanics, and say something about velocipedes, as I hear through the papers that they are coming into use in San Francisco. I would suggest that some person have one huilt with the Redstone mechanical device, patented April 29, 1862, (converting rotary into a reciprocating motion) and if it is not the hest arrangement that can he put into one, I am mistaken. The device may he constructed with a haudle upon the top of each,—the slide placed at quarter stroke; and as it works in a straight line over the axle, the handles may he hrought hetween the knees of the person operating the machine, and straight in front, so that much more force may he applied with the same exertion that is now used in propelling the present machine. This device I think will perfect the velocipede.

A. E. R.

Activity in Mining.—Not the Whlte Pine developments alone are causes of the increased interest in mining, which is ohservable at the present time. From the immense amounts of machinery, stamps, crushers, amalgamating pans, etc., that have passed through Stockton and Sacramento to the interior mining counties, every evidence is given that the development of quartz leads has received a new impetus; and a large amount of iron pipe has been manufactured in this city and in Nevada County especially for the hydraulic mines, to take advantage of the present rainy season; showing that gravel mining is, if anything, more than holding its own. Concerning Eastern sentiment on the subject, the Philadelphia *Ledger* says :

"The mining interests of the United States have heen attracting more attention during several months past. As an evidence of the truth of this, we see it stated that one firm heavily engaged in the manufacture of mining machinery, reports that it is in receipt of large orders in their line, and that they still continue to come. The going out of favor of mining operations in the last few years was not so much the unproductiveness at the mines as it was the breaking up of companies created by speculators, who hoped to profit hy the sale of shares."

[Written for the Mining and Scientific Press.]

Letter from Idaho.

Boise City, Jan. 8th, 1869.

The snows of the past three weeks have been very heavy, but not so much so as to stop mining at Yuba and Rocky Bar.

MINING OPERATIONS.

The Atlanta ore is richer than ever, and the silver is heing rolled out in sheets. The present streak is several inches wide, and right along the lode and apparently increasing as descended upon, assaying 75 per cent. silver. When an owner who has been absent a few weeks was told of it, he said, "that's nothing, we have becn taking rich ore out so long that we are not surprised if we strike a vein of pure metal."

The Leonora holds out as good as ever.

Chesley Woodward is preparing the Varieties lode for energetic spring operations.

At Rocky Bar all mills are suspended for the winter, hut the company under the superintendence of John McNally, Esq., are running a new tunnel ou the lower level, to strike the Wide West lode about 350 to 400 feet underground. This lode has hitherto proved rich, and the company want to know what they have got.

Jackson & Co. are runniug a tunnel for the Silver Star lode, in order to get the lode in shape for working or sale, as circumstances dictate.

Dr. Bishop, resident director of the Lucy Phillips Company, (English) has lately sent a large lot of specimens of ore from various lodes at Yuba, and a brick of hullion from each of those represented hy specimens, to Loudon, to be publicly shown there as samples of the "Gem of the Mountains," and if we mistake not it will make "phlegmatic John Bull" open his eyes to see how much Idaho will soon he ahle to do towards helping to give us a return to specie payments, in lieu of "old rags."

LOCATION OF THE RAILROAD FROM SALT LAKE TO PUGET SOUND.

The difference between the two routes from Salt Lake down Snake River, and in the vicinity of Boise City, now heing surveyed for the Union Pacific and Puget Sound Railroad, (spoken of in the last uumber of the Press) is this : By Camas Prairie or Malade River there is timber twenty miles up the Malade, with a good farming valley, and from thence there are at short distances small valleys where "garden stuff," etc., can be raised; and the whole route is a splendid grazing country, coming on to Willow and Indian Creeks, Sixteen-Mile Creek, and Boise Valley, iu all of which the land is good, and farmers are living. On the other route, it is "desolation," and there is not a mile of good land in the whole distance; and were the land ever so good, the nearest timber on the north of the Snake is twenty miles distant and on the south side ahont forty miles, while up the river it is a hundred or two, and down the river fully as far.

Qnery then—Which appears to be the route the railroad should go?

Big Camas Prairie is not more than thirty-five miles from Yuba hy directest route, and the same from Rocky Bar; and it takes in all the settlements now occupied, and in fact all that can reasonably be made of any consequence.

On the Snake River in the winters of 1864-5-6-7, the snow remained longer, and was much deeper than along the majority of the distance on the upper route. These things I know personally. There is not at present any snow to speak of, except in the mountains; the plains and prairies are hare, and the weather is warm as spring, grass growing on the hills. Perhaps for forty or fifty miles through the Camas Prairies there may be some snow, hut not enough to stop a railway engine.

If two feet, or two feet six inches of snow is causing alarm here to Col. Hudinutt and party, how will the Black Hills trouble them, and what of the Northern Pacific Railroad, which the Colonel concludes must be huilt to meet the requirements of the age? Again; the Owyhee people on the southern side of the Snake, do not want this railroad ucar them; what they need is a branch from Silver City to couuect with the C. P. R. R.; and thus they wish, as we do, to see the cars runuing through or near our town.

Alturas.

Mechanical.

Strength of Steel Rails in Winter.

One of the objections which have been made to steel rails for roads in cold climates, is their supposed liability to break or snap in very cold or frosty weather. Very elaborate experiments made by Prof. Styffe of Stockholm, have shown that this opinion is erroneous. Mr. Saudborg, in a paper read before the Institute of Civil Engineers, says:

"The trial of iron and steel for tensile strength under the influence of extreme temperatures, such as boiling water and at the freezing point of mercury, has led to the discovery, contrary to the general belief, that the tensile and absolute strength is greater during cold than during ordinary temperature; that is, iron or steel is stronger in winter than in summer. The reason why more breakages occur in winter than in summer is asserted to be the extreme cold affecting the elasticity of the supports, (sleepers); and it is said that elasticity in any way given to the rolling stock also favorably affects the resistance of the rails.

"However, if the supports have the same elasticity in summer as in winter, as, for instance, would be the case with granite rock, then Prof. Styffe asserts that the same rails, either of iron or of steel, can resist a heavier blow from a falling ball at the temperature of extreme cold than on a hot summer's day. Although the experiments have been conducted with the utmost care and skill that science and money can afford, it seems desirable that this theory should be proved on a larger scale than Professor Styffe has had an opportunity of doing, before it can be relied upon."—*Hewitt's Report on the Iron and Steel at the Paris Exposition, p.* 140.

The Engine of the Future.—The double-bogie engines of Fairlie are described under the above head by the *London Railway News*, as having a tractive power equivalent to the drawing a gross load of 390 tons up a gradient of 1 in 25, at a speed of ten miles an hour. The weight is so distributed over the twelve wheels, that the pressure upon the rails is actually less than that put upon it by the old style of engine. The fuel and water are carried on the engine itself, the necessity for a tender is dispensed with, and the whole weight carried is made available for adhesion or grip on the rails. The bogies are free to swivel on their pins, and each engine radiates independently of the other; so while passing round even an S curve, each bogie can accommodate itself to the direction of the curvature without in any way interfering with the action of the other. One of these engines has been at work for some time past on the Neath and Brecon Railway, and Captain Tyler described its motion over new and sharply-curved portions of the line as being so free from violent motion and oscillation, as to suggest to him the idea of "sailing."

Refining Iron without Puddling.—A new process, now in practical operation in Pittsburg, is thus described by the Clevelaud *Herald:* "The melted metal is taken direct from the blast furnace and run into a large kettle of a capacity of five tons. From thence it is poured, in a stream about a foot wide, into a circular trough, twelve inches wide and ten inches deep, revolving on a radius of seven feet, or fourteen feet diameter. Pulverized iron ore, Lake Superior, Champlain or Iron Mountain, is used as the converting agent. The ore descends from a hopper into the revolving trough, and covers the melted metal as fast as it is poured in. The continuous revolutions of the trough produce alternate thin layers of hot metal and raw ore, and effect the combination in a very satisfactory manner. The machinery which accomplishes this is moved by steam and hydraulic power, and is so well planned that one man, standing with his hands on valve-levers, can manage the whole operation. When the trough is full, and before the iron cools, it is broken up into slabs of suitable size for the beating furnace."

The Broad Gauge.—"We understand that after this day there will be only one broad gauge train run daily between London and Birmingham. On every other portion of the line the third rail is being removed, and laid down for the narrow gauge in other parts."—*London Railway News, October* 31.

Heaton and Bessemer.—The London *Times* contains a letter from Mr. Bessemer in regard to the absurd claims for the "Heaton Process." A portion of this letter, giving a concise and lucid statement of the difference in the products derived from the two processes above named, is here quoted: "In the Bessemer process, by simply forcing atmospheric air in numerous jets upward through five tons of molten pig-iron for a period of fifteen or twenty minutes, the iron is converted into fluid cast-steel; the oxygen contained in the air, uniting with the superfluous quantity of carbon present in the pig-iron, produces an intense combustion, and raises the temperature of the metal to the extremely high point necessary to retain the steel in a state of complete fusion, without the employment of any additional fuel; the fluid thus obtained, when poured into molds, forms a solid homogeneous mass of cast-steel, entirely free from ecoria or other mechanically mixed impurities.

But in the Heaton process nitrate of soda mixed with sand is employed to generate the necessary amount of oxygen gas for decarburizing the pig-iron, instead of employing the cheap gaseous oxygen of the atmosphere. Now, whenever solid substances are converted into gas, a vast amount of heat is absorbed and rendered latent; hence in the Heaton process so much heat is abstracted from the metal in generating oxygen gas by the decomposition of nitrate of soda that the metal solidifies while in a state of mechanical admixture with the sand and soda, and thus, instead of obtaining fluid cast-steel by his process, Mr. Heaton obtains only a lump of spongy, porous metal, intermixed throughout with slags and ecoria, and having the general characteristics and properties of ordinary puddled-iron or puddled steel, but which is only obtained at a cost (for nitrate of soda) of more than double that of the ordinary puddling process."

Boutet's Bridge.—We have already given the laugh of *Engineering* at this "*Pons asinorum.*" That journal finds it necessary to allude again to the scheme, for the benefit of those incompetent persons who have been induced to regard it favorably in consequence of the notice taken of it by several influential papers, and to warn such persons before they allow themselves to be imposed upon. The whole project is a wild one, and may easily be shown to involve a hundred impossibilities. In the first place, a buoyed rope is to be stretched across the channel from France to England, *as a ranging line*, to define the positions for the placing of the nine iron piers which are to be built on shore and floated to place. This rope will, it is plain, never be in the same position for two successive hours;—swayed and curved as it will be by the tides and currents, which will be constantly acting upon it. Again;—the iron cables to be stretched between the great towers, 360 feet high and two miles apart, *will break by their own weight* before they are tautened to within five hundred feet of their position! Many details of the scheme further show,—says the journal in question,—that M. Boutet, though doubtless in earnest, "is grossly ignorant of the most elementary laws of nature."

Electro-plating with Nickel.—It is reported that this has been successfully accomplished by a Boston chemist. The great difficulty to be overcome is to obtain a positive electrode, or the plate from which the metal is taken to be deposited by the battery on the articles at the negative electrode. Nickel is obtained only in small particles, associated with other metals, such as iron, copper, and cobalt, and is infusible by ordinary processes. Hence pure nickel is not easily obtained.

Large and Small Boilers.—Each have their advantages. In favor of large capacity are, steadiness in the pressure of steam, ready deposition of impurities, space for the collection of sediment, and freedom from foaming. In favor of small capacity are, rapid raising of steam to any required pressure, small surface for waste of heat, economy of space and weight (which are of special importance on board ship) greater strength with a given quantity of material and smaller damage in the event of an explosion.

Scientific Miscellany.

Cell-Structure of Metals.—A paper by W. Vivian, recently read before the Liverpool Polytechnic Society, presented some interesting points in regard to the microscopic structure of metals. Mr. Vivian classes metals under two heads, viz,, those the structure of which is angular or crystalline, and those in which it is cellular or porous. The cellular structure is most highly developed in those metals which we have found to be the best conductors of heat and electricity; and its perfection is in proportion to the capacity for such conduction. "The 'fiber,' or 'silky luster,' exhibited in the fracture of good iron,"—says Mr. V.,—"is only the effect of the light reflected from inner surfaces of myriads of minute cells exposed by the fracture. The form of these, in their normal state, is spherical, or nearly so, but becomes changed in the process of rolling. The mechanical properties of tenacity, ductility, etc., must greatly depend on the perfection of the cell system; a crystalline malleable iron does not show prisms in its fracture, but simply a number of faces or planes crossing the cells at right angles, cutting them off short. The process of rolling iron into plates or sheets does not obliterate these cells, but merely modifies them, as they widen out under the pressure; the thin partitions become laminated, and on the regularity of this lamination the quality of the plate very much depends. The cell system of copper is more perfect than that of iron, a result of the pouring of the copper into molds, but the cells are afterwards altered by the pressure in rolling, etc., but never destroyed. If it were possible to make a section one-millionth part of an inch in thickness these cells would be seen."

Discovery of Metallic Hydrogen.—Our readers will recollect the several allusions which we have made to Prof. Graham's experiments upon the occlusion of hydrogen by various metals. The last named of these metals was palladium. Further experimentation has resulted in convincing the Professor that the union, in this manner, of palladium and hydrogen, is in fact "an alloy of *hydrogenium*,—a white magnetic metal, of specific gravity about 2,—which appears to bear considerable analogy to magnesium." If Prof. Graham has really solved the question as to the metallic nature of hydrogen, he has made one of the most important discoveries of the century. The announcement has just been made by letter to Prof. Horsford, a communication from whom was read at a recent meeting of the New York Lyceum of Natural History, by Prof. Joy.

Man in the Palæozoic Age.—The following is from the Buffalo *Courier* of a recent date: "There are now on exhibition at the rooms of the Society of Natural Sciences, in this city, two of the most remarkable discoveries recorded in the annals of science. One is the fossil imprint of the foot of a man, or rather the cast of such an imprint. It was discovered by a workman, in a colliery in western Pennsylvania, in the shale overlying a run of coal and underlying two other veins which were being worked by the company. The spot where it was found was nearly a mile from the pit's mouth, and some 300 feet from the surface. The rock in which it was imbedded belongs to the palæozoic age, and the imprint, if such it be, was made millions of years before the present geological era commenced. It is the cast of the left foot of a man of ordinary size, and is perfectly defined. The foot was evidently protected by a sandal or moccasin; the heel, the arch, and the ball of the foot, and the slight depression made by the toes, are perfect."

"By a curious coincidence, the society, a few days before this donation, received the second specimen from the Rev. Samuel Cowles, of Gowanda. It is a large slab of sandstone, on which, stamped in the solid rock, can be seen the imprint of horses' hoofs, as perfectly preserved as though they were formed yesterday upon the muddy bank of a sluggish stream. There are at least a dozen of these impressions, varying in size from the track of the full grown horse to that of a young colt."

Arctic Exploration.—The French expedition to the North Pole will, if possible, start so as to reach Behring's Strait by the end of July.

Picric Acid Gunpowder.—Barlinetti, of the University of Padua, has mixed picric acid with KO, ClO^5, and finds the product to detonate under a slight pressure. He discovered also that a mixture of 10 saltpetre, 10 picric acid, and 8.5 bichromate of potash, behaves like the best sporting powder, without exploding by percussion. Finally he succeeded in leaving out the saltpetre, and producing a stronger powder, from equal parts of the other two. It is not hygrometric, leaves little residue, and may possess some advantages for certain uses.

M. Cleroitad has studied the applicability of *picrate of potash* as a gunpowder; and claims that it possesses advantages. It detonates at 590° Fah. In the open air its products of combustion contain cyano-hydric acid and NO^2, but in a closed space they are but nitrogen and oxygen gas, and KO, CO^2 mixed with carbon. The advantages claimed are its absolutely *definite* character, composition, and strength; absence of sulphur, which rapidly destroys artillery; ease and safety of manufacture, and insolubility in water. On the other hand, when dry, it has the same objection as gun-cotton, of exploding by simple percussion.

Alaska a Thousand Years Ago.—Prof. Carl Neumann, of Munich, a diligent student of Chinese antiquities and bibliography, has discovered from the Chinese year books that a company of Buddhist priests entered this country, via Alaska, a thousand years before Columbus. They explored thoroughly and intelligently the Pacific borders, penetrating into the "land of Fusung"—for so they called the Aztec territory, after the Chinese name of the Mexican aloe. The collection of antiquities recently made by Capt. Fast from graves, etc., in Alaska, consisted chiefly of carved ornaments and weapons, resembling those now made by the Chinese, and apparently belonging to a race totally distinct from the present Alaskans.

Microscopic Germs in the Air.—The following is from the Boston *Journal of Chemistry:* "At the Manchester (Eng.) Royal Infirmary, an ounce of distilled water in a pint bottle was aërated with the atmosphere of one of the wards until it had become slightly opalescent. In the deposit thrown down, after forty-eight hours, distinct evidences of the presence of organic life were perceptible under the microscope; and on the fifth day there were numerous actively moving vorticelli, with abundance of monads in ceaseless motion. From this it may be inferred, if the same experiments were repeated under varying circumstances, it might be shown that the presence in the air of microscopic organic germs is a constant condition easily detectable.

Plumage Pigment Soluble in Water. At a recent meeting of the Birmingham Natural History Society, says the *Colliery Guardian* of December 19th, Mr. T. Fidian exhibited the spectrum of the feathers of the touracon *(turacus albocristatus)*, as compared with that of blood, with which it is almost identical. This rare bird is found on the gold coast of Africa, and the specimen first brought to this country suggested the suspicion that they had been skillfully dyed, from the fact that upon being washed the scarlet color of the feathers disappeared. The remarkable discovery was, however, made that the natural red pigment of the plumage is perfectly soluble in water, and the still more remarkable one followed that it contained so large a proportion of copper that the feathers of one bird yield about three grains of that metal.

Flexibility of Itacolumite.—This mineral,—the laminated quartz rock which is the matrix of the diamond,—has been analyzed by Wetherill. He finds it to consist of 96 per cent. of silica, the remainder being iron and lime. Its specific gravity is 2.69. Its peculiar flexibility, which has been ascribed to the scales of mica which are scattered through it, is found by Wetherill,—who examined its structure carefully with the aid of the microscope,—to be one innumerable ball-and-socket joint which exist throughout its mass. This flexibility is such that a rod of it, supported at the ends, assumes the form of a curve;—very nearly the catenary.

Contributions for cur Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 334.—Mountain cather, or mountain cork, a variety of asbestus, in which the fihers are no longer visible. It has the same composition, and in fact is the same mineral as hornblende, amphibol, tremolite, calamite, actinolite, amianthus, ashestus, etc.—silicate of magnesia, lime, alumina and iron, or manganese, which assnmes appearances so different as scarcely to be suspected of being the same thing, except by those who have traced the mineral through all its varieties. Mountain cather is a decomposition product, filling out crevices in veins. It looks like white-tanned buckskin, or coarse pasteboard, and in thin laminæ it floats on water. From the dump of the Eureka mine, Grass Valley, probahly obtained at about 400 feet depth. Presented by O. Hyde.

No. 335.—Iron garnets, or almandinc, in remarkably perfect tropezohedrons of one-eighth of an inch in diameter. From the island of Espirita Santo, Lat. 24° 28′ N., Lon. 110° 21′ W.; where they occur pleutifully in the decomposed rocks. Presented by Augustus D. Jenny, U. S. S. Lackawanna.

No. 336 to 347 inclusive. Suite of lithological specimens from the tunnel of the Imperial Silver Quarries Company, Monitor, Alpine Conuty—valnable because from them a geological section of the mountain might easily be constructed.

No. 336 (marked I).—Tho bedrock through which the tunnel has been run 560 feet, is locally known as porphyry. Unluckily onr specimen got mislaid before it was properly examined; it was a compact eruptive rock of plutonic appearance, and of the greenish tinge and general characteristics of diorite; thongh probably one of the porphyritic varieties of the lavas of which Silver Mountain is composed. The country rock proper in that district is granite.

No. 337 (II.)—calcspar, beautifully crystallized in geodes in I.

No. 338 (II A.)—Granular calcspar, very friable, found in streaks in I.

No. 339 (III).—Gypsum, fonnd in crevices in I. It is in delicate transparent needles, which are sometimes of a pink color.

No. 340 (IV).—Dark colored quartz from a stratum (or vein?) two feet wide between I and V.

No. 341 (V)—Trachytic tufa, containing mica crystals, called elvans in Cornwall; a fine-granular, rose colored rock, occurring in dykes and veins traversing the country, somewhat laminated in structure, from lateral compression probably.

No. 342 (VI.)—Mineral resembling a petrification (adjoining IV), but hardness only 3. Some hydrous silicate.

No. 343 (VII.)—A reddish metamorphic porphyry, fonnd in strata and nodules through V. Decomposition products similar to it are common in volcanic districts.

No. 344 (VIII.)—Quartz croppings, with geode containing minute crystals covered with iron.

No. 345 (IX.)—Sulphuret of antimony.

No. 346 (X, XII and XIII.)—Silicious concretions occurring in V, more or less laminated.

No. 347 (XI.)—Same as No. 338, but having a red streak of ferruginous quartz between the calcspar and porphyry.

Williamson's Commned Terrestrial and Celestial Glone has beeu attracting attention in the window of Roman & Co. It is a common globe inside of a glass globe, the latter having all the contellations marked upon it. With the aid of an accompanying book the geography and movements of the stars may be intelligently pursued, without a master.

White Pine Items.—All our exchanges are full of news about White Pine.

The Eherhardt *vs.* Richmond suit, which was on trial for two weeks at Austin, (Nev.) was given to the jury at half-past 12 o'clock, Jan. 23d, and after an hour's deliberation they rendered a verdict for the plaintiffs, standing nine to three.

Five passengers from White Pine arrived in this city night beforc last,—says the *Times* of Jan. 26th,—each the fortunate possessor of ahont $100,000, the proceeds of their season's operations in the newly-discovered Silverado. Three of the number had grown rich by selling the proprietorship, or shares, in well-known mines, and the two others, by selling, aud by the proceeds of mines in which they still hold considerable interests.

It is estimated that by the 1st of next June pay ore will be mined in profitable quantities from not less than five hundred mines. The locations have averaged one hundred per day for the last three months.

Near Shermantown there are said to be true fissure veins, the Irvine, for example, containing ruby silver, which mineral is characteristic of all appearing to be true veins around Treasure Hill.

Labor is $5 a day; lumber $225 to $400 per thousand feet.

Twenty-five or thirty freight teams pass through Austin daily for White Pine, and both stage routes via Elko and Austin, are still crowded and hooked ahead for several trips.

The principal mines on Chloride Flat being unable to get ore crushed, have gone to work sinking their shafts deeper, in search of new deposits of ore beneath the first. It was expected that rich ore would he struck at seventy feet from the surface.

Base Metal Lixiviation before Amalgamation.—Twenty pounds of White Pine base metal ore—malachite and azurite, or the green and hlue carbonates of copper—assaying $4,500 in silver to the ton, have just been treated by Adolph Hoffman, M. E., with the aid of the Kustel lixiviation process; the result being 31·64 ounces of silver, of .900 fineness, and of the value of $36.82. Had the ores beeu sulphurets, the treatment would have been quite the same; first roasting, to get rid of the sulphur, until withiu an hour of the usual desulphurization, then adding six to ten per cent. of salt, and chloridizing the base metals by a low red heat—the silver not being chloridized, or scarcely so, by anything less than a white heat, such as would again decompose the hase metal chlorides. As the latter—the chlorides of copper, lead and iron—are soluhle in warm water, nothing is to hinder leaching them out, and getting rid of them before amalgamating. All the copper in the solution is then saved by precipitating it with iron. Where the base metals cannot be beneficiated without previous roasting, and where salt is not too dear, this process is an economical one.

Proscriptive Duty on Foreign Copper.—Mr. Cole has laid before Congress a petition from the owners of the Napoleon, Keystone, Buchanan, and Nevada No. 56, copper mines, asking the passage of a law excluding by a prohibitory duty all descriptions of copper, but allowing the free importation, by drawhack, of the amount of carbonnte ores of copper necessary to the consumption and use of the sulphurate ores of the United States. The petitioners submit a draft of a bill to accomplish the latter object, which makes the refunding of the dutics contingent on the production of evidence by the importers that they have used the foreign carbonate or oxide copper ores for smelting purposes, in the proportion of one ton of imported copper ore to two tons of copper ore mieed in the United States.

Schulenberg's Concentrator.—We omitted to state in our notice of Mr. Schulenberg's modifications of the German percussion table, (in the Press of Jan. 16th) that a caveat has been filed for him through this office, and that Mr. Schulenberg's claim is that it will work very cleanly for 10 to 15 stamps, and will save, besides sulphurets, also float gold and quicksilver.

The South African gold fields are not as rich as at first believed.

The Chinese call California the Golden Mountain.

Explosive Agents for Mining Purposes. Mr. Abel has prepared pellets of compressed gun cotton, containing ahout three-fourths their weight of nitro-glycerine, and coated with some hard material. These pellets or grains are safely handled and transported, and are more powerful as an explosive,—it is said,—than dynamite. Lighted in the open air, they burn, but do not explode. But the great discovery of the day, in this direction, is that of Mr. Brown, of the English War Office Chemical Establishment. He has found that gun cotton alone, if exploded by means of a detonating fuse, is equal in effect to nitro-glycerine. Large blocks of granite, and heavy iron plates, have been shattered hy exploding in this way small charges of gun cotton simply laid upon the surface, and not in any manner confined. One who has seen gun cotton go off with merely a slight puff, when touched with a lighted match, will he surprised to hear this; but it is even so.

It would seem that a new era for the miner was ahout to commence. Tamping, the most dangerous of all mining operations, will be done away with. The discovery will interest the military engineer hardly less than the miner. A stockade may be demolished by a simple train of gun cotton discharged by a detonatiug fuse at one end. It is said that the subject is occnpying much attention at Woolwich and Chatham.

New Impetus and Methods in Prospecting.—Chloride and pocket deposits heing in quest, since the discovery of Chloride Flat, new ideas have been formed about prospecting, and fresh enterprises are set on foot for the exploration of the great interior,—which is no longer to remaiu as an nnknown wilderness. For intelligent prospectors a little reading up on the nature of the decompositions of vein minerals where the veins are weathered, or exposed to alkaline waters, would prove of the greatest value. Dana's Mineralogy contains perhaps the most information on the subject. Intelligence, and ample information about the nature of the minerals searched for, are the best equipments.

Concerning systematic prospecting parties which are organizing for operations in Eastern Nevada, one under Mr. Joseph Angell left Silver City lately, which took with them, among other things, a boring machine similar to those in use for sinking artesian wells, and sufficient pipe for boring to the depth of eighty feet, with the necessary tools for keeping the bits of their three-inch augur in proper condition. The first experiment with it was to be in the "cap rock" of Chloride Flat, if there was snfficient space found untenanted in that argentiferous locality for a hole of that size.

Steam Engine for a Flying Machine—or a Velocipede.—A five-horse power petroleum-burning steam engine, weighing only forty-five pounds, has just beeu made by Mr. Kallenberg, the model manufacturer and machinist, at No. 10 Stevenson street. It is intended for a flying machine which has been constructed in this city, the details of which are understood not to be in a position to be given to the public at present. Meantime it is suggested that so light an engine, furnishing five-horse power, would do very well for a velocipede; being certainly capahle of doing more work, against adverse grades, than one-man power. With rubber tires, and with such an engine, it is suggested that a three or four-wheeled velocipede, having large eight-foot wheels, might do some "tall traveling" up-hill or down hill. The boiler is constructed somewhat like the Harrison boiler, with a number of tuhes, which contnin the steam; so that it would be on impossihility for steam to explode it.

A vein of quicksilver has beeu discovered in Solano County, seven miles from Vallejo.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

For the Week Ending January 12th.

85,746.—Improvement in Plows.—David A. Manuel, Napa City, Cal.:

1. The landside D, when provided with tho vertical projection D′, the pivot *c*, tho slots *s s*, and the wedge-shaped extremity, all arranged and constructed in a simple piece of cast metal, snbstantially as described and for the purposes set forth.

2. The mold-board A, when constructed in the shape described and shown, pivoted at its middle to the rear edge of the landside by an arm C, operating as described, and provided with flanges *i i*, arranged under the landside edge at the ends; all constructed and operating in combination with the landside above described, substantially as and for the purposes specified.

3. The combination of the landside and mold-board above described, with the lever F, pivoted at *e*, and connected with a sliding lock-bolt *e*, arranged inside of the landside in a slot or chamber prepared for the purpose, substantially as described, and for the purposes set forth.

85,763.—Improvement in Governors for Steam Engines.—George T. Pracy, San Francisco, Cal.:

The cups J, springs C, arms F, and lugs I, combined and arranged substantially as described for the purposes specified.

A perspective view of this governor can be seen in our advertising columns. The same was fully described in our issue of September 10th, 1868. The inventor is manufacturing and introducing them with success, which is a good indication of their merits.

85,817.—Improvement in Steam Engine Cut-Offs.—Thomas Hanshrow, deceased, Sacramento, Cal. (Lucy A. Hansbrow, and B. B. Redding, executors):

1. The cylinder I and plunger *h*, in combination with the cut-off valve and seat, substantially as herein shown and described.

2. The arrangement of the cam M, arm K, governor spindle L, valve seat C, valve E, piston *h*, small cylinder I, and cylinder A, as herein shown and described.

85,833.—Improvement in Potato Digger. Seth Kinman, Eureka, Cal.:

1. The combination of the shovel K with fingers K^3, the two vine-cutters O O, and the two oppositely revolving wheels L, and M, constructed and arranged in relation to one another substantially as set forth.

2. The combination of the supplementary frame D, to which is attached the shovel and other mechanism for taking the potatoes out of the earth, and the main frame B, when the double tree D′ is attached to the former, and the tongue B′ to the latter, substantially as and for the purpose set forth.

3. The combination of the main and supplementary frames with the system of levers, shafts and arms for regulating the depth of the plow attached to the latter frame, substantially as set forth.

4. The combination of the main frame and supplementary frame, and the perforated rods E for adjusting the relative position of the two frames, substantially as set forth.

85,838.—Improvement in Gang Plows.—William Mason, Independence, Oregon.:

1. In a gang plow the bent axle hereiu described, consisting of the parts D D′, the part D′ being bent at right angles, and having one of its arms fitted in a socket on the end of the part D, the former being made adjustable relatively with the latter by means of uut *n*, and set screw *t*, as and for the purpose specified.

2. In combination with the frames E F, crank axle D D′, crank shafts J J′, and plows C C, the levers I K, connecting-rod M, and treadle N, as and for the purposo specified.

3. The arrangement and combiuation of the levers K L N, rod M, stops *a a a*, and crank shafts D D′ J; when said parts are constructed to operate in the mauner specified.

4. The lever N, when provided with the flange *i* and adjusting screw *s*, substantially as specified.

Rolling Mill.—Railroad iron and fixings, screw bolts, anchors, steamer shafts, aud a variety of forgings, are heing made at the Rolliug Mill. The Pacific Forge steam and trip hammer, formerly at the Mission, are now employed here.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, January 30, 1869

San Francisco Savings Institutions.

Annexed will be found our usual interesting statement concerning the savings and loan societies in this city, compiled upon the same basis as that of the interior savings banks, published by us in our last issue. This statement embraces the report of the eight institutions for the semi-annual term closing with 1868, as well as the aggregates since January, 1866, the date since which we have been compiling these data:

NAME.	Date of Organization.	Open Deposit Accts., Jan 1st	Deposits.	Loans.	Gross Earnings.	Reserve Fund	Expenses and Federal Tax.	Cash on hand.
Hibernia Savings and Loan Society	April 7, 1859	14,065	$2,846,307 34	4,750,863 77	260,211 29	$214,344 37	19,710 36	240,692 57
Savings and Loan Society	July 23, 1857	4,550	4,748,863 77	3,306,208 75	215,838 57	78,037 28	19,519 11	148,045 77
French Savings and Loan Society	Feb. 1, 1860	3,800	3,306,208 75	2,421,658 94	132,810 73	115,082 70	14,447 89	153,451 43
San Francisco Savings Union	June 18, 1862	3,577	2,421,658 94	2,35,184 20	132,810 73	115,082 70	14,447 89	153,451 43
Cal. Building, Loan and Savings Society	May, 1861	1,900	909,023 24	762,324 37	22,619 80	66,779 00	3,309 05	73,258 00
Odd Fellows' Savings Bank	Oct. 13, 1866	739	503,040 09	497,768 35	2,325 22	2,307 90	4,385 46	24,333 73
Farmers' and Mechanics' Savings Bank	July 1, 1867	352	151,269 09	139,301 30	10,597 16	10,597 16	4,400 45	16,098 16
German Savings and Loan Society	Feb. 10, 1868	935	448,681 29	476,134 64	17,540 79	40,637 15	1,400 45	23,886 63
Totals—January, 1869		29,893	$22,372,708 37	$19,658,464 07	$1,134,696 65	$736,986 49	$102,895 75	$1,026,119 51
Totals—July, 1868		26,085	19,658,464 07	16,838,465 99	955,853 17	551,867 88	91,914 53	1,024,090 75
Totals—January, 1868			16,838,465 99	13,218,690 22	843,917 40	485,700 07	68,520 77	824,381 08
Totals—July, 1867			13,218,690 22	10,193,914 18	694,310 89	470,079 46	64,931 69	1,100,508 17
Totals—January, 1867			10,358,884 40	8,827,110 05	564,459 85	326,936 92	48,718 88	892,760 11
Totals—July, 1866			8,760,184 52	6,754,302 83	432,750 54	272,918 94		830,980 27
Totals—January, 1866			7,005,051 63		306,060 80	236,935 63		674,668 10

The foregoing interesting table furnishes the very best stand-point from which to judge the financial condition of our working classes. It shows an increased aggregate deposit of $5,430,613 since January 1868, and of $2,694,144 since July of last year. The increase in the nnmber of depositors since Jnly 1868, was 3,828.

The dividends for the term of six months under review are as follows: Hibernia, 10 per cent. per annum; Savings and Loan, 10 per cent.; French, 11 per cent.; Savings Union, 11 2-5 per cent. on term, and 9½ per cent. on ordinary deposits; California Bnilding, 10 per cent. to depositors and 12 per cent. to stockholders; Odd Fellows', 12 per cent.; Farmers' and Mechanics', 10 per cent.; German, 11 2-5 per cent. on term, and 9½ per cent. on ordinary deposits.

We herewith give the increase and decrease of the several societies under the various headings in our tabnlar statement for the six months just closed, as compared with the semi-annnal reports made in Jnly, 1868:

HIBERNIA.

	Increase.	Decrease.
Open Deposit Accounts	1,900	
Deposits	$1,216,418 05	
Loans	1,144,326 48	
Gross Earnings	53,270 89	
Reserve Fund	35,796 32	
Expenses and Federal tax	2,125 66	
Cash on hand	155,902 08	

SAVINGS AND LOAN.

	Increase.	Decrease.
Open Deposit Accounts	137	
Deposits	$380,130 96	
Loans	384,803 71	
Gross Earnings	41,914 83	
Reserve Fund	35,240 12	
Expenses and Federal tax	2,157 06	
Cash on hand	31,808 44	

FRENCH.

	Increase.	Decrease.
Open Deposit Accounts	300	
Deposits	$210,867 51	
Loans	313,563 26	
Gross Earnings	34,334 13	
Reserve Fund	17,812 45	
Expenses and Federal tax	5,587 11	
Cash on hand	$52,929 77	

SAVINGS UNION.

	Increase.	Decrease.
Open Deposit Accounts	525	
Deposits	$396,874 99	
Loans	293,121 18	
Gross Earnings	24,067 01	
Reserve Fund and Stock paid in	10,398 93	
Expenses and Federal tax		$3,160 12
Cash on hand	115,346 04	

Included in the Reserve Fund is the sum of $90,000, being the amount of stock paid in.

CALIFORNIA BUILDING, LOAN AND SAVINGS.

	Increase.	Decrease.
Open Deposit Accounts	134	
Deposits		$24,817 18
Loans		4,902 07
Reserve Fund and Stock paid in	$49,592 97	
Cash on hand	27,103 72	

The Reserve Fund includes the stock paid in, and the "cash on hand" city bonds in their possession, the amonnts of which we have been nnable to ascertain. Neither have we been able at any time to obtain a full report, as from the other societies.

ODD FELLOWS'.

	Increase.
Open Deposit Accounts	198
Deposits	$199,812 36
Loans	202,572 14
Gross Earnings	9,792 60
Reserve Fund	1,008 12
Expenses and Federal tax	1,138 05
Cash on hand	5,811 67

FARMERS' AND MECHANICS'.

	Increase.	Decrease.
Open Deposit Accounts	81	
Deposits	$25,233 73	
Loans	37,524 55	
Gross Earnings	870 60	
Reserve Fund	2,307 90	
Expenses and Federal tax		$34 02
Cash on hand	24,610 96	

No Reserve Fund reported in Jnly, 1868.

GERMAN.

	Increase.
Open Deposit Accounts	553
Deposits	$290,123 88
Loans	320,420 89
Gross Earnings	14,180 79
Reserve Fund and Stock paid in	21,741 80
Expenses and Federal tax	2,947 48
Cash on hand	16,133 83

Included under the head of "Reserve Fund" is the sum of $40,000 capital stock paid in.

Mining Share Market.

We report a rather brisk market since our last similar reference, and a more general participation in the stock arena of claims of less intrinsic value than the usnal line of sales. We may remark an appreciation of several claims, hut, so far as reported, the merits of this improvement are not made manifest; however, several drifts in the lower levels on the Comstock ledge arc hopefnlly prosecuted.

IMPERIAL—improved from $139 to $149, and closed at $144 50. Further receipts of bullion, amounting to $9,861, have been credited to January acconnt, making $28,822 to date. On the 26th inst., the drift on the 1000 level had been carried in 3½ feet during the previons twenty-four hours. Both mills are running to full capacity, and from the Alta mine they are hoisting 140 tons of ore per day.

HALE & NORCROSS—advanced from $59 to $68, and closed at $68 50. This company is still running a single drift south, showing no material change. In the north drift they have not got the tunnel far enongh in to commence work on the ore. In the third station they are cutting out for a windlass, and will commence sinking a winze in a few days. The shaft is below the fifth station timbers about four feet.

GOLD HILL QUARTZ—is qnoted at $55@70. The receipts of bullion for January acconnt to date are $5,389 47.....CONFIDENCE rnled at $34@35. Bullion acconnt for Jannary, $5,696 36.....CROWN POINT advanced to $70, declined to $64, and closed at $66 25. The developments, as yet, are not cnconraging.

BELCHER—proved qnite active during the past week, improving from $18 50 to $21, and closing at $19 50. A telegram of the 21st inst., received at the office in this city, states "that they cnt a body of ore six feet wide, showing an average assay of $91. The vein going south from the shaft, on the 335 level, promises a large body of ore."

KENTUCK—has been less active than usual, selling at $235@241, and at the close realizing $232. The bullion receipts to the 22d inst., for January, show a yield of $57,827.....CHOLLAR-POTOSI sold at $168@172, and closed at $171 50.. For the week ending Jan. 22d, extracted 900 tons of ore. The 1100 station drifts, north and west, are in porphyry, and the south drift from the 920 rnns in clay mixed with lime and porphyry, and is now 90 feet from the shaft. ....OPHIR has advanced in price. On the 27th inst., the shaft had been timbered 692 feet, and the sinking had been carried 14 feet fnrther, making the entire depth 706 feet. So soon as the sump is completed, requiring about twelve feet more, drifting will he commenced on the 700 level.

NEW VARIABLE CUT-OFF.—We have received from M. C. Taylor, of Grass Valley, a model of a variable cut-off, for steam engines, which is simple in construction, and which appears, in view of the importance of the matter of cut-offs for economizing the expansive force of steam, to have met a desideratum. Mr. Taylor has applied for a U. S. patent through this office.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT.	DAY DELINQUENT.	DAY OF SALE
Amador Co., dividend, $6 per share	Payable Dec. 19, 1868	
Alamo, Lyon co., Nev., Nov. 25, 35c	Dec. 31—Jan. 30*	
Bacon, Storey co., Nev., div	Payable June 19, 1868	
Belcher, Storey co. Nev., Dec. 31, $25	Jan. 30—March 2	
Crown Point, Storey co., Dec. 18, $7 50	Jan. 23—Feb. 15	
Chalk Mountain, Nevada co., Jan. 15, $2	Feb. 15—March 8*	
Chollar Potosi, div, $25	Payable Oct. 15, 1867	
Crown Point, dividend, $7.50	Payable Sept. 12 1868	
Cosala, Sinaloa, Dec. 12, $1	Jan. 15—Feb. 4	
City R. R., San Francisco, Jan. 5, $5	Feb. 10—March 6	
Daney, Lyon co., Nev, Jan 9, $2	Feb 12—March 1	
Eureka, div. $5	Payable Nov. 20, 1868	
Empire M. & M., Nev., dividend 1, $1	Payable May 15, 1867	
Gold Hill Cons., Storey co., Jan. 8, $4	Feb. 13—March 1

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SOUTH VIRGINIA S. M. CO.—Lander County, Nev. Jan. 22d. Capital stock, $1,600,000; 16,000 shares, $100 each. Trustees: R. F. Morrow, G. W. Beaver, E. B. Stonehill, S. C. Estes and M. Ehrlich.

PECK S. M. CO.—White Pine district, Nev. Jan. 25th. Capital stock, $100,000; Trustees: E. T. Peck, W. A. Batemen, Louis Teese, Jr., H. J. Paine and T. A. Nichols.

GOLCONDA MINING CO.—White Pine district, Nev. Jan. 25th. Capital stock, $800,000; 800 shares, $100 each. Trustees: John D. Fry, Alvinza Hayward, A. P. Crittenden, E. T. Pease and J. F. Boyd.

TEESE S. M. CO.—White Pine district, Nev. Jan. 25th. Capital stock, $100,000; 1,000 shares, $100 each. Trustees: Lewis Teese, Jr., W. A. Bateman, E. T. Peck, H. J. Paine and F. A. Nichols.

HOLCOMB MINING CO.—White Pine district, Nev. Jan. 25th. Capital stock, $800,000; 8,000 shares, $100 each. Trustees: J. D. Fry, A. Hayward, A. P. Crittenden, E. T. Pearce and James T. Boyd.

FEATHERSTONE M. CO.—White Pine district, Nev- Capital stock, $400,000; 400 shares, $100 each. Trustees: M. J. McDonald, J. W. Gashwiler, S. Heydenfeldt, G. D. Roberts and E. B. Dorsey.

TREASURE TROVE M. CO.—White Pine district, Nev. Capital stock, $525,000; 5,250 shares, $100 each. Trustees: John C. Bower, John Achweitzer, Calhoun Benham, John Wieland, Wm. S. Byrne, Joseph Frontin and J. G. Sourdry.

CAYUGA CHIEF M. CO.—White Pine district, Nev. Jan. 27th. Capital stock, $1,200,000; 12,000 shares, $100 each. Trustees: G. W. Beaver, J. Nightingale, R. G. Brown and J. A. Eaton.

THE LADIES, too, are said to have very generally accepted PLANTATION BITTERS as a means of relieving the nervons debility and derangement of the circnlation, to which so many of the sex are liable. It is certainly an agreeable restorative—so palatable, indeed, that it may properly be ranked among the Cordials. Its medicinal ingredients, about which no mystery is made, comprise some of the finest tonics and alteratives of the vegetable kingdom, and the vehicle in which these are administered, pure St. Croix Rum, is undoubtedly the most harmless and nutrimental of alcoholic stimulants.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Jan. 16th: The Globe tunnel, which is now nearly 100 ft. on its way towards the great Hercules lode, which it will strike at good working depth in from 300 to 400 feet more, has enconntered of late very hard rock, but qnite recently is entering that of more favorable working character.

Chronicle, Jan. 16th: The Rippon Co. is getting ont better rock than heretofore.

AMADOR COUNTY.

Jackson *Ledger*, Jan. 23d: The owners of the Casco mine have determined to go down 200 ft. deeper. At present they are in a black greasy gonge, which is looked upon as a sign that a good vein is close at hand. The 20-stamp mill, erected by the owners, Haley & Hardenburg, is about one-fourth of a mile from the mine, on the bank of the Mokelumne river, and is without exception the best specimen of a mill we ever examined. It is run by water, of which there is an abundant supply the year round. The batteries are of the most substantial kind, and work like a charm. Four of Hungerford's conceutrators are attached to the batteries, by which all the snlphurets are saved.

The Coney Co. have determined to sink another shaft 200 ft. south of the present one 8x4 ft. in the clear. Steam hoisting works will be placed on it, and by this means the facilities for taking out rock will be doubled, and as their vein is a very wide one, they will be able to keep 40 or 50 stamps running nigbt and day.

The proprietors of the Kearson mine, near town, have obtained snch flattering prospects lately that they have determined to erect a mill on the lead dnring the coming summer.

Jan. 23d: Last winter, Green, Goodwin & Co. purchased what is known as Hartman's garden in Volcano, for the purpose of mining it out. They commenced work the 1st of April last, with a force of five men, and up to the 1st of December they had taken ont over $15,000. and the claim is good for many thousands more.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, Jan. 23d; A new custom mill is being erected at Railroad, by James Smart. The battery will consist of eight stamps. The motive power is to be furnished hy a burdy-gurdy water wheel.

The excitement in relation to the mines in the Railroad Flat district, continues unabated, and the probabilities are that it will prove such a powerful counter-irritant as to neutralize the White Pine fever in this section of the country.

On the Petticoat work goes steadily forward. The mill leased for crushing the rock—a 10-stamp battery—is never idle. The ore averages better than that taken from any other mine in the State, and the lead has been prospected sufficiently to establish its permanency beyond a shadow of a doubt.

Chapman & Co. have resumed labor upon their claim. They have a shaft 60 ft. in depth, the rock from which yielded largely. Owing to the lack of machinery for pnmping purposes, water has risen in the shaft 30 ft. At that point the company are running levels npon the lead. The rock being taken out will pay handsomely.

Sanderson & Co. have abandoned their old shaft and engaged in sinking a new one in a more favorable locality for working the mine. They have some 60 or 70 tons of rock ont, which will be crushed as soon as facilities offer. The lead is narrow but the ore is rich. The proprietors are sanguine that their mine will prove eqnal to the best.

Labor is being vigorously pushed forward on the Chemisette, owned by the Misses Lancaster, with highly satisfactory results. The shaft has not reached any great depth, but the ore, from the top down, prospects finely.

The Balmoral, another claim located and owned by ladies, shows well on top, no work having yet been done npon it.

Work is being prosecuted upon a large number of veins in the vicinity, and new location are made almost daily.

The Angels correspondent writes: The mines of this place are beginning to attract much attention, even from mining men in San Francisco.

About four months ago the Angels Mining Co. decided to sink 200 ft. on the vein; as they went down the lead improved rapidly, and at a depth of 300 ft. from the surface they have developed a well defined and paying vein, and are now, and have been for the past few months, making handsome dividends. The ore is of much higher grade than nearer the surface.

W. H. Bovee, who for the last two years has been working his mine successfully, has leased his mine to Crouise & Crossman, of San Francisco, for a period of two years, with privilege of buying. Mr. Bovee erected, last fall, a fine 50-stamp mill. Cronise & Crossman are opening up the mine and preparing to work on a much more extensive scale than has been done heretofore. Some very rich qnartz is obtained in this mine, and the ore of high grade on the average. In sinking, the Bovee mine, like many others, may be found in places to be partially mixed with slate, but there can scarcely be a doubt that it will prove one of the richest mines in the State.

The Sickles or Union quartz mine, is being worked by the owners with good success for the amount of work done. They have a 10-stamp mill on the claim, propelled by water power. The lode commencing at the Bovee mine and passing along through the Dr. Hill, the Angels quartz mine, the Lightner, the Utica, to the Stickles mine, seems to attain its greatest power and width at this point. Their ore is all paying ore and not mixed in the least with slate, as far as they have sunk, n depth of about 200 ft. The width of the vein ranges from 15 to 24 ft. of paying qnartz. The company are sinking and opening up their mine slowly.

The Mokelnmne Hill correspondent writes: As to the relative merits of the Sutter and Railroad Flat ranges of qnartz, the preference must remain with the Sutter, as the veins are large, true, and consequently permanent, while those of Railroad are, as yet, not sufficiently developed to make any calculations upon. The Sutter range of mines require a heavy outlay of capital to make them profitable, but when made so can be depended upon for many years, thus offering superior inducements for the investment of capital. On the other hand, the Railroad range is composed of thousands of small, segregated veins, rich, without doubt, as they prospect from $20 to $150 to the ton, and have the merit of being easy to find and not expensive to work when found.

And then we have the gravel range southwest from this town, which covers a greater extent of territory than I was aware of until my recent visit to Central Hill district. I can do no more than mention the different claims, as my limited time will not admit of anything like a description. Traveling from the lower end of Central Hill we pass the Monitor, Merrimac, Jackson & Co., Squiers & Co., Hatfield & Kane, Green & Guy, What Cheer, Rough Diamond, Bradley & Co., Petersou & Co.. Shaw & Co.

KERN COUNTY.

Havilah *Courier*, San. 19th: We understand that Messrs. Dalton, of Nevada County, are negotiating for the Adelphi and Countess Tyrone mines, and the mill connected therewith.

MARIPOSA COUNTY.

Mail, Dec. 22d: The old Washington mine near Qnartzburg, still coutinues to pay handsomely. We are informed that for two runs made last night, of 10 and 12 days each, there was realized $2,500 and $2,700, making an aggregate of $5,200; and this was obtained at an expense of $1,500—leaving a clear profit to the proprietors for 22 days crushing of $3,700.

We were shown, last Monday, a fine specimen, composed of gold and qnartz—the gold prevailing. It belonged to G. W. Payne, who selected it from among other rich rock which he is now taking out of a vein by him discovered and located. The lode is on the old trail from Mariposa to Colorado, We are informed that the vein, so far as prospected, gives every evidence of being rich. There are, doubtless, thousands of lodes eqnally rich lying hidden within a few feet of the surface in this county.

We learn that Mr. Charhonel has leased and intends to immediately commence working the Morning Star ledge. The Morning Star is near the Mariposa Creek, about one mile below the Frances quartz mill. It has been laying idle for some time, but is now in the hands of a scientific and practical miner, under whose management the vein will be thoroughly tested.

NEVADA COUNTY.

Transcript, Jan. 20th: The Brown claim, located on the blue cement channel near You Bet, continues to return handsome profits to the owners. After the last run of five days, less four hours, they took ont 18 lbs., avoirdupois, of dry amalgam. The expense of doing this was only about $400.

Jan. 23d: A correspondent, writing from Bridgeport township, sends the following: Last week Pat. Fogarty bought the whole of the tail flume in the South Yuba river, leading from Jones Bar. Consideration $4,000.

G. Tanner & Co. have located 1,200 feet on Green Horn Creek, commencing at Knickerbocker Cañon, and extending to Nebraska Cañon, for mining purposes.

For 10 days past mining operations have been entirely suspended at Yon Bet and Quaker Hill on account of the freezing weather. The miners are all ready, their claims being fitted up for a long run, and the present storm will, probably, enable them to commence operations.

The old Larimer mill on the Higgens ledge on Wolf Creek, is being thoroughly renovated and much improved. The mill will be in running order by February. One hundred loads of excellent rock are now out awaiting this time. The rock looks well, is of a blue color, shows free gold, and plenty of fine rich sulphurets. It is good for $50 per ton. They are now down about 125 ft. from the surface; at this distance the ledge is full 18 inches wide, is easily worked and promises well.

Jan. 24th: The storm at this writing is exceedingly favorable for mining interests. For a week or two past the ditches have been frozen and the supply of water scant for mining purposes in consequence. The present rain will soon break up ice and give abundance of water.

Gazette, Jan. 23d: We are informed by a gentleman from Forest Springs that qnartz mining in that locality is quite brisk. The Slate Creek ledge, owned by Perrin & Co., is now being worked with great energy. The company have spent $3,000 in opening new drifts. They have attained a depth of 370 ft. on the incline. The ledge at this depth averages two feet in width. Two tons are mined daily to each man, and eight men are now employed in the drifts, making an average of 16 tons per day. The rock from this mine, for the last year, paid from $18 to $60 per ton—averaging about $30. Perrin had crushed at his mill 1,001 loads, which produced in the aggregate $23,000. The articles of incorporation of this mine were filed in the County Clerk's office in this county a few days since. We learn that Mr. Perrin has purchased the extension of this mine, and has run a tunnel on the ledge from Wolf Creek into the hill 160 ft. which gives them about 600 ft. backs, the bill being very steep. The extension bids fair to become one of the best mines in that vicinity. Mr. P. has a water power quartz mill on Wolf Creek. He crushes the rock from two Slate Creek ledges, also from the Grant, and other claims in that locality.

Jan. 28th: Thos. Johnson and others have recorded a qnartz location, on a ledge situated in Grass Valley township, bounded on the north by that of Morton & Co., on the west by Mary's Ravine, and on the east by the claims of McClunes & Co. The ledge is called the Grecian Bend.

Grass Valley *Union*, Jan. 21st: The Kux Co. who own a good looking ledge in the bed of Wolf Creek, talk of incorporating preparatory to working their claims.

The Young Pines Co. will also incorporate at an early day, so that work npon their ledge may be carried on without the uncertainties of partnership arrangements. The Young Pines Co. own the south extension of the Grass Valley ledge, and their property is supposed to be valuable.

We hear that arrangements for the early resumption of work at the Allison Ranch mine are in progress, and that everything looks bright for the company.

Jan. 22d: The Eureka mine of this place has made its regular monthly dividend of $20,000.

The Garden City mine is now being pumped ont after a long time of idleness, and some good rock has already been obtained from it.

Grass Valley *National*, Jan. 21st: Frank Smith & Co. have located 400 ft. of ground on Fall Creek for mining purposes.

Jan. 22d: We recently visited the Empire mine and found everything progressing finely. The 30 stamps crush 40 tons of rock every day which pays from $25 to $30 per ton, without counting the specimens which are frequently found. We saw some of extraordinary richness which were brought up two days ago. The gold is saved at the Empire in a somewhat different manner than that employed at the Eureka. No blankets are used, but the gold is amalgamated in batteries and on copper plates alone. The sulphurets are separated by Hendy's concentrators, and then pass into the Baux & Guiod's separating amalgamators, of which there are 16. Quicksilver, cyanide of potassium, and bluestone are also put in these pans for six or seven hours, the pulp is drawn into another set of grinding pans, Howland's, where it is again ground to an impalpable fineness, and every particle of gold brought into contact with the quicksilver. The sand and other foreign matter is then flowed ont, and the pure amalgam to be retorted as usual. The Empire men claim that this method of working sulphurets is better than the chlorination process, because it not only is much less expensive but secures more gold. They have tried both ways. The Empire sulphurets contain about one-seventh of all the gold that is obtained from the rock, and in value vary from $30 to $300 per ton, the average value being about $80.

SAN BERNARDINO COUNTY.

Los Angeles *News*, Jan. 16th: A rich gold and silver mine is reported to have been discovered recently near the town of San Bernardino.

SIERRA COUNTY.

Downieville *Messenger*, Jan. 23d: Everything seems to be quiet in various parts of the county. There is no water yet to wash stock dirt. The miners commenced to wash at Port Wine, but had to stop, the water giving out, owing to the cold weather.

Rock recently mined by Ned Leonard from his ledge above the graveyard, is the richest yet taken out there, gold being visible in all portions of it.

The miners in the river are still working their claims, the river being as low as at any time during the summer. The boys who are working under the town, also set their pump at work a few days since.

A rich quartz ledge was recently discovered between Howland Flat and the Slate Creek House. The ledge is just below the Monitor sawmill, and is called the Lincoln ledge. The Lincoln, the Grant and the Colfax, have recorded their claims. The rock is said to look well.

The Gold Bluff Co. commenced crushing rock from their mine on Monday last. They have a large quantity of rock out, and men enough at work to keep the mill running most of the winter. The rock is rich, but how much it will pay to the ton we do not know. The mill is a 12-stamp water mill, and is capable of crushing about 18 tons in 24 hours.

SISKIYOU COUNTY.

Yreka *Union*, Jan. 17th: A nugget of gold weighing three pounds was taken from the claim of Poncho & Co., near Hawkinsville, on Thursday last. Its value is estimated at $500, there being some quartz mixed with it. It was found in the dirt about three ft. from the bedrock.

Lauer & Co. at Humbug, are now taking out quartz of a very superior quality from the Knapp ledge. The rock from this ledge has averaged a little over $50 per ton. Lash & Co. are engaged in running a tunnel into the Accidental which will strike the ledge about 105 ft. below the surface. The tunnel will be about 170 ft. in length.

Miners at Scott's Bar have returned to work again on the river claims.

The Scott's Valley correspondent writes: Joe Magill and others have struck No. 1 diggings near Capt. Haislip's store on the East Fork of Scott River. Hall & Co. have just struck it rich at Yellow Pine. They showed me three bits to the pan taken out this week, from these new diggings in the gulch near Hall's store. Hall informs me that the diggings are extensive, and are easily worked as the gold is mixed in the dirt from the surface to the bedrock, which is but from three to five feet deep. The prospects are that we will have lively times this spring on the East Fork and at Yellow Pine.

TRINITY COUNTY.

Weaverville *Journal*, Jan. 23d: The miners at Park's Bar are all busy and in the best of spirits.

The mining claims recently opened at Taylor's Flat are paying well, and the Washington Fluming and Mining Co. are selling all the water in their ditch.

The miners in and around Columbia are busy at work, but as the water has been in camp only a short while, none have washed up.

The Star mine, at American camp, has shut down for the present; but work will be resumed within a month, and will be prosecuted then more vigorously than ever before.

Hiskey & Stage are busy at work on the Grant mine, near the Star, erecting a large 10-stamp mill, with all the necessary hoisting apparatus for taking rock out of the mine.

YUBA COUNTY.

Marysville *Appeal*, Jan. 26th: We learn that the Pennsylvania ledge now being worked by superintendent Cummins, is 24 feet in width, and the entire rock pays well.

COLORADO.

Georgetown *Miner*, Jan. 7th: Hnependen, Wolters & Co., have shipped, since our last report, $700.60 in silver bullion, coin value. Owing to the scarcity of water, they are unable to run to their full capacity.

Schirmer & Bruckner took off, on Tuesday last, 1,348.5 ozs. of silver bullion, coin value, $1,820.47. The amount would have been treble what it is, had not their cupel given out.

Prof. Stewart has taken ont and shipped, during the month of December, 2,064.75 ozs. of silver bullion, coin value, $2,353.91.

Central City *Herald*, Jan. 6th: One mine on the Bates or Hunter, which is run by actual miners, produced last month with 20 stamps, 196 ounces of the retort worth about $4,150.

We saw another 519-oz. brick of silver at the Rocky Mountain National Bank yesterday.

There are some parties in this city who claim to have information of the discovery of new gold mines of unusual richness, in some gulches tributary to Snake river, about 300 miles north of Salt Lake. These parties are making preparations to emigrate to the new gold fields at once.

We saw a specimen of silver ore from the new district, on the head of Chicago Creek, yesterday, which was very rich. It had been burned in the fire, and the silver had oozed out in small globules. The prospectors of that district are going to organize some time this work.

A valuable discovery has recently been made on the side of the Mammoth Mountain, further up the gulch towards Central. It was made by Mr. Bolthoff, who has others interested with him. The lode shows a strong vein of rich quartz, in which particles of free gold can be seen without the aid of a glass.

The New York 35-stamp mill is one of the best paying institutions of Gilpin County. We happened in there the other day and found the mill full of ore, and the men all busy at work. The U. P. R. and Burroughs are at present supplying this mill with ore, but Mr. Hays says he could keep three times as many stamps constantly employed if he had them.

The Smith & Parmelee Gold Co. produced 933 ozs. of gold in December. They started up their 75-horse power engine yesterday, and to-day their new 25-stamp mill. They have 12 Bartola pans, and one large stone arastra, which will be run on blanket tailings. They expect to produce from 50 to 60 ozs. of gold a month from the pans. The mill is geared to drop the stamps 40 times a minute—running the stamps rapidly with coarse screens and changing the blankets every 15 minutes. They expect to treat 100 cords of ore per month with a 25-stamp mill.

IDAHO.

Owyhee *Avalanche*, Jan. 16th: Prospects in Flint district are in the highest degree encouraging. The Rising Star mill is turning out bullion at the rate of between $2,000 and $3,000 per day. The mill, in every department, is a complete success. We have been shown some specimens of ore taken from the lower level of the mine, which surpass in richness any heretofore found.

Boise *World*, Jan. 14th: There are 19 men wintering in Deadwood. The prospects are very bright for a most prosperous ensuing season of mining, and diggings which could not be worked last year for want of water can next season be thoroughly mined.

MONTANA.

Helena *Post*, Dec. 25th: We were attracted to the assay office of Stephen F. Molitor, Saturday, by the sight of a brick, which contained gold to the amount of $12,000, in currency.

Mining upon the Park ledge is now being more actively prosecuted than ever before. On the west end of the lead the Whitlatch Park Mining Co., is pushing forward its work with great vigor and is sinking four shafts at a rapid rate, all of which give evidence of the permanency and richness of the mine. One of the shafts in particular, that located between claims Nos. 4 and 5 west, has attained a depth of 60 feet and exhibits the most flattering results that have ever been secured in any section of the country. Excellent pay rock four feet in width there greets the miner.

The Union mine of J. C. Ricker is turning out some fine ore. There are already 1,000 tons of excellent ore ready to be crushed, and not less than 10,000 tons of equally good quartz in eight, in his immense shafts, tunnels and inclines. And this large body of rock, sufficient in itself for a year's supply to his mill, is being constantly increased.

For a week past the I. X. L. mill has been engaged in crushing rock for Mr. Whitlatch, taken from the discovery claim on the Park. Although this rock was unselected, 130 tons of it yielded $37.30 per ton.

The Sterling correspondent writes: Capt. Maltby, who has been running upon the Red Bluff rock during the past summer with most flattering results, has stopped his mill to clean up and renovate some of the machinery, but after a delay of a few days he will begin to crush quartz from other lodes. The Hobart mill, of small capacity, is working away in Lower Hot Spring district with a most favorable show of success.

The incline on the Gonu Extension of the Union lode is now over 20 ft. down, and the vein is still widening. The discovery shaft is 125 ft. east, by linear measurement, of the eastern limit of the Union, and directly on line with the improvements of the Ricker I. X. L., Whitlatch Union, and National Mining and Exploring Co. Solid granite walls enclose the vein, from the top down. Many of the specimens exhibit free gold, and the rock generally prospects splendidly.

From Highland we learn that Prof. Swallow's mill is now engaged in crushing rock from the Forest Queen lode. The mill has not ceased running since it first started.

NEW MEXICO.

A correspondent writes from Elizabethtown to the Colorado *Chieftain* of Dec. 25th, concerning the Moreño mines as follows: All work upon claims, except the development of quartz leads has ceased. Since the cessation of gulch mining, many rich quartz leads have been discovered, promising in their appearance, and abundantly supplied with wide crevices of the richest quartz. Prominent among these may be mentioned the Pacific, Great Eastern, Great Western, Grey Eagle, Empire and Eureka. There seems to prevail but one opinion in regard to the future of this mineral region. That the gold is to be found in quantities that will pay, has long since ceased to be a question of doubt, for the yield during the past season, even with the limited facilities for successfully working the mines, will compare favorably with any hitherto discovered gold country. Companies have been organized to commence spring operations on an extensive scale. Several new stamp mill have been ordered. Two mills are already in successful operation, one belonging to Maxwell's company, on Ute Creek, the other to Bartholomew & Lowthau, near the mouth of Humbug Gulch. The latter mill has not yet made a sufficient run to fairly test the quartz it has been crushing. The mill on Ute Creek is still in full blast and is daily turning out a large amount of bullion. In a little less than two days' running, 26 ozs. were cleaned up. This is about the average yield and the mine from which the quartz is taken is apparently inexhaustible.

The Moreño ditch will be completed early in the spring, in readiness to supply all the water necessary for gulch mining.

NEVADA.

HUMBOLDT.

Unionville *Register*, Jan. 9th: The Silver Mining Co. shipped this week 1,421 ozs. of bullion, and Fall & Co. shipped 6,612 ozs. of fine bullion.

Jan. 16th: Smart & Morrison are working the Syracuse mine, in Pantber Cañon, on the west side of the Humboldt range. Their prospects are of the most flattering character.

At a late meeting of the De Soto Co., it was resolved to take measures to resume operations on the mine in the spring. Preparations will be made for either the erection of a new mill or the purchase and repairing of the old Sheba mill.

The Winnemucca correspondent writes: John O. Twiss and Frank Shaw have bought the Weymouth Co's location on the Pride of the Mountain, and will commence work immediately.

Buck & Kunkel, on Monday last, sent below 15 tons of assorted ore from the Pride of the Mountain, labelled "Swansea."

REESE RIVER.

Austin *Reveille*, Jan. 19th: It is reported in this city that a fine body of rich ore has been uncovered in the vein of the Great Eastern mine, in the Twin river district.

The stage which arrived last evening from Belmont brought to this city six bars of bullion from the mill of the Belmont Co.—the product of ore from W. F. Leon & Co's El Dorado South.

We learn that a fine quality of ore has been found in the 300-foot level of the South American mine, about 30 feet to the westward. The vein is large at the point, but the stratum of richest ore is from ten to twelve inches thick.

Jan. 21st: We learned yesterday from Col. Wheeler, who returned from the Grant district a few days ago, that nearly all the ore there exhibits a fair proportion of gold; and in the case of the Poorman vein the assays of the ore gave nearly one-fourth gold.

White Pine *News*, Jan. 16th: The principal mines being unable to get their ore crushed, have gone to work sinking their shafts deeper in search of new deposits of ore beneath the first. It is the general impression that a succession of ore deposits or veins separated by intervening strata of limestone will be found in sinking shafts. So far as the developments have yet been carried in that direction they tend to confirm this theory. Many new shafts have been started lately for the purpose of striking this second vein, upper one being previously claimed and worked by others, and new locations are made daily for that purpose. The shafts are multiplying so rapidly in some parts of the flat as to leave scarcely room to dump the dirt taken from them.

The Belmont shaft, near the Applegarth cabin, and Emmet mine on Chloride Flat, struck a good quality of ore on Tuesday last, at a depth of about 25 feet. Another strike was made the day following on the flat next north of Chloride Flat.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Jan. 20th: Wells, Fargo & Co. shipped from their office in this city during the year 1868, 3,912 bars of bullion, valued at $6,560,492.28.

The Twin Mining Co. at Silver City, are still working their claim with good results. They have lately sunk an incline in their lower level to a depth of 200 feet lower than they have ever gone before, and have found the most flattering indications of permanency. They will now be able to take out large quantities of excellent milling ore.

The South Yellow Jacket works, which were stopped last week to make certain requisite repairs to the brakes and other machinery, have started up again, and everything is running at full rate. One hundred and forty tons of ore were raised day before yesterday from the 900-foot level.

Jan. 21st: The total receipts of the Crown Point Mining Co. for the month of December were $38,573, and the disbursements $33,775. About 1,200 tons of ore were crushed, yielding $30.15 per ton.

The receipts from the Kentuck Mining Co., thus far on January account, aggregate $26,304.

During the week ending last Friday, 600 tons of ore were raised from the Chollar Potosi mine, averaging $41.53 per ton.

Jan. 22d: The new Ophir shaft is now down to a depth of 680 feet.

Jan. 23d: The Savage Co. shipped day before yesterday, by Wells, Fargo & Co., 22 bars of bullion weighing 1,414 pounds, and valued at $36,881.48.....On the 16th inst., the Crown Point Co. shipped $9,429.15. This mine shipped on the 17th inst., $5,497.....The total shipment of bullion from this city during the past week was 4,832 pounds, worth $134,890.28.

Jan. 24th: The Hale & Norcross Co. now have a body of fine ore, some six feet in width, in their north drift. It assays from $40 to $50 per ton.

BRITISH COLUMBIA.

Opening of New Coal Mines on Vancouver Island.—A dispatch dated Victoria, Jan. 21st, says the Wallace coal mines, at Soaquish, near the northern extremity of the island, are being rapidly opened. A tunnel has been driven into the side, and the coal is said to be equal to any yet discovered on the island.

Acoustic Oddity in a Water Fall.—A curious, though not uncommon phenomenon occurred at the Benton dam on the 18th inst. The water in the river, which had been raised a little by the rain of the day before, was running over the dam in an almost unbroken sheet of three to six inches in depth. One portion of this sheet—perhaps twenty feet broad—acquired in falling a tremulous or wavy motion, probably from the action of the air between it and the face of the dam. This vibratory motion produced a heavy, thunderous and oppressive sound like the low, deep notes of a large organ, or the roaring of the fan of a reverberatory furnace, which was almost deafening at a certain distance and position from the fall, although the quantity of water was comparatively insignificant. Close observation showed that the falling sheet of water was wrinkled or corrugated horizontally, like an old-fashioned *wash-board*, at intervals of six to eight inches between each wave or wrinkle. On a rough estimate, about thirty-five of these little waves fell per second. The noise could be interrupted for a moment by throwing a stone into the water at the crest of the dam, thus breaking up the wavy motion—but would immediately recommence. *Mariposa Gazette.*

Dr. John A. Veatch, the well known chemist and geologist, of this State, has been elected Professor of Chemistry in the Willamette University.

Enterprises and Developments.

The Vallejo Building Association will build forty tenement-houses at South Vallejo.

Elko already boasts a population of 250. Freight to White Pine is eight cents per pound.

Fifty-seven new vessels have been built in California during the past year, chiefly in San Francisco Bay.

It is said that 50,000 acres will be put in wheat this season between the San Joaquin River and the Coast range.

There are over 800 laborers employed at Mare Island. The amount of money disbursed on account of last months' service, was about $92,000.

A deed has been signed transferring over to Mr. Henry Meiggs the contract entered into with Mr. Arman, for the working of the Mejillones guano beds, on the western coast of South America.

A company has been formed to throw a dam across the outlet of a considerable valley eastward from Los Angeles, to make a reservoir which will supply a large body of water for irrigation.

A company is being formed at Vallejo to build a street railroad, from the north side of Georgia street, through Santa Clara, Virginia, Sonoma, Pennsylvania, Maryland, Sixth and Lemon streets, down to the railroad wharves, connecting the old and new towns.

Placerville now looks forward to a new era, in which horticulture shall be the chief basis of its prosperity. With cheap freights, cheap water, and a favorable climate, a rich soil, and a large population in the adjacent valleys, it may become the center of a better business than it ever had.

Coover and Franklin are about to set out 10,000 mulberry trees, in Los Angeles County. Mr. Prevost, the pioneer in the silk business, intends to make a plantation at San Gabriel. D. F. Hall, of San Gabriel, proposes laying out a silk town on the San José ranch, the land lying on both sides of the San Bernardino and Los Angeles road, about thirty-two miles east of Los Angeles.

The Mexican cedar and mahogany rate nearly as high for shipbuilding as the sal and teak wood of the East Indies. The live oak of Florida has long been famous, but it is surpassed in the quality and durability by the mahogany of Mexico. Some Spanish ships which were constructed of this material, were found to be as sound at the end of eighty years as when they were launched.

The Prospects for Additional Woolen Mills.—To show how little, comparatively, is yet being done in woolen manufacture on the coast, it is only necessary to state that the five mills in Oregon and the six in California are now running, all told, fifty-five sets of machinery (or about 22,000 spindles), while the Washington mills alone (one of the large corporations at Lawrence, Mass.) have in operation ninety-six sets of woolen machinery, and half as many more of cotton. Were the number of mills (or sets of machinery) doubled in California and Oregon within the next year, they would not consume the annual clip of wool. Folsom, with its water-power is suggested as an admirable place for the location of woolen mills and other manufacturing establishments.

Agricultural Manufactures are already quite extensive at Pacheco, Contra Costa County. The gang plows manufactured by Dalton, Whitmore & Gavin, and Betts, all of different construction and methods of coupling, and raising, are sold for $95 and $100, and about fifty of them have been made this season at the three shops. The three, four, and six-horse cultivators, chisel and scoop points, have, within the past year or two, become one of the great farming reliances, and are made at prices ranging from $37 to $80, and more than 100 of them having been made and sold this season, most of them by Dalton. The single cast steel plows made here are sold at an average price of $20, and about 60 have been made and sold. The large harrows, of which about 50 have been made and sold, range in price from $35 to $50. Shops at Walnut Creek, Danville, Antioch, Martinez, and other points in the county, have been full of like orders.

An Eyelet manufactory in Providence, R. I., is now turning out eyelets at the rate of 500,000 a day, and the export for a year has amounted to $3,000,000 worth. In 1867 we imported very nearly as many. This is an industry that has germinated and fruited since the war. Its success is doubtless attributable to some peculiar excellence of machinery.

MINING AND SCIENTIFIC PRESS.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:

Saturday Morning, Jan. 30, 1869.

Notices to Correspondents.

SOAPSTONE, Shaw's Flat, Tuolumne County. The value of soaptone depends upon its quality and adaptation for the particular purposes, which would create for it a demand, and fix the price corresponding thereto. Soapstone is not by any means a rare mineral; it occurs in many different varieties, and is a hydrated silicate of magnesia and alumina. It is the softest of minerals, being hardness 1 of the mineralogical scale. Its uses are to carve out uteusils of all kinds, especially such as are to resist heat, as gas burners, cookery utensils, furnace material, etc; it is also used for polishing, as a foundation for mixing colors, as tailors' chalk for drawing lines on cloth, etc. The Chinese Figure stone, agalmatolith, is mineralogically allied to soapstone, but is hardness 3,—equal to limestone. At present, soapstone has no market value in San Francisco. It has been offered to stove dealers for stove and furnace linings, but does not appear to be sought after for that purpose. It is one of those articles for which a demand may be created by manufacturing it into useful utensils or marketable products, or by finding out some special purpose to which it may be adapted.

MINER, Chorokce, Butte County.—To free quicksilver from lead, zinc, or tin, acids may be used; or the quicksilver may be retorted with a layer of charcoal powder strewn over its surface in the retort, to keep back the less volatile substances. Salt is mixed by some with the charcoal powder. By pouring a quantity of acetic acid over quicksilver, the lead in the latter being attacked, will rise to the surface in the form of a carbonate or white lead, which can be skimmed off. Nitric acid, diluted with double its quantity of water, may be used very effectively, agitation and a temperature of about 120° Fah., hastening the process. The crust in this case, contains mercury in the form of nitrate of mercury, which is recovered by digestion or boiling gently with nitric acid; diluting the solution, filtering, and then precipitating the mercury with metallic copper.

COMMUNICATIONS have been received from W. H. M., embracing notes of the Santa Cruz Tannery and Fuse Factory, Porter's Tannery (at Soquel), the Santa Cruz lime kilns, paper mill and powder works; the Gilroy Tobacco Factory, etc., which will appear in our next issue.

A. M., MENDOCINO CITY—It is not easy to recognize or to name the mineral from your description. Send a specimen.

CONCHOLOGY.—A collection of about a million shells, embracing nearly all the known species on this coast, and in the Pacific Ocean, the collecting of which occupied a period of thirty years, is for sale by A. Frick, at No. 562 Bryant street. This collection is valued at not far from $3,000.

Our Mining Stock Experiences.

The principle of developing mines of established wealth, or indeed of accomplishing any other great work promising certain rewards by combination,—in other words, by means of joint stock companies,—is undoubtedly correct. All of the great triumphs of man over matter, owe their execution to organization, effected either by a personal or arbitrary power, or by a combination of working powers having a common interest, and therefore selecting a common head. It was the personal and arbitrary kind that built the pyramids, but it is the republican kind of organization and combination that developed commerce, populated the oceans with ships, and accomplished the great works and triumphs of modern times; and even monarchy is an impossibility, and an absurdity unless it is based on a virtual republic in the shape of an aristocracy.

Most of the profits that individuals are to derive from mining as a permanent business, will have to come through combination. River gold, and chloride silver deposits, are soon exhausted, needing no especial combination of powers to unlock great stores of wealth; though it is not to be denied that even in their case colossal combinations may operate to effect. But the advantages are in favor of the lucky and shrewd, rather than of the powerful and systematic.

The first Washoe silver excitements flowered into an infinite multitude of theoretical joint stock companies. But the theoretical can be distinguished from the practical even in stock matters. Tuthill's History sums up the results, as they stood after the summer of 1864, as follows:

"The brokers vacated their offices; a few men went into insolvency. The masses pocketed their losses, and said little about them. They filed away their certificates of stock, lately so carefully treasured, as curious, useless pictures, tokens of experience gained, and pushed on with their legitimate business. It is astonishing, considering the amount of money that changed hands during the popular possession by this mania, how few were seriously injured by it. Wages were good, salaries high, business brisk. They paid high for their experience, and could afford it. The map of the country was written over with the localities of mineral deposits rich and abiding, though it might not pay to work them for some time to come. The prospectors had made a geological reconnoisance in force. As of all such preliminary surveys, the advantages were not immediately developed."

It is reported that steps are being taken to organize a stock board at Treasure City, which is to go into operation immediately on the completion of the telegraph line to that place, or about the middle of next month. Stock boards are like the market place or the plaza, centers of intelligence, convenient for making trades, and nothing more. But as fish will go after bait, it is not improbable that a number of brokers' offices will be doing an extensive business in buying and selling stock certificates (great numbers of which are being printed in this city) of unexplored mines at White Pine.

As to the opened and partially developed chloride deposits, brokers and others are afforded the finest opportunities in the world for legitimate gambling. In *bona fide* transactions it is a notoworthy feature of the White Pine mining developments that the greatest skill is exercised, and the best judgment commanded, in calculating the percentages of silver in the chlorides, and of the admixture therewith of earthy impurities; the parties concerned bringing to bear all the available lights as to the size and extent of the deposits in question.

THE Ninth Annual Report of the Gould & Curry mine has been received embracing statements by the President, Alphous Bull, and by the Superintendent, David Bowie, together with a diagram of the Bonner shaft, by J. E. James, C. E.

What the Standish Steam Plow Has Done.

This question is now asked with a good deal of interest by farmers, and especially by land-holders owning considerable tracts of arable soil in the level valleys. That the favorable reports with regard to the work done by the plow, and the building of a new plow of enlarged capacity, which is just completed at the Union Foundry, are justified by the successful manner, economically, in which the machine has encountered the test of practice, under intentionally unfavorable circumstances, will duly appear from the following particulars.

The Kilichor ranch, of 800 acres, between Clayton and Pacheco, Contra Costa County, is of a moderately rolling, gravelly character, and the ground is of that hard, dry and tough character which is peculiar to California; the exact consistency of which will be best understood by farmers from the fact that it required a team of three horses to draw a single 12-inch plow running four inches deep. The land was plowed last two years ago. In this the steam plow accomplished from two to three acres an hour,—three acres when everything was going all right,—plowing to a depth of five inches, and consuming from eighty to one hundred pounds of Mount Diablo coal to the acre; the plow pulverizing the ground thoroughly at the same time, and therefore requiring no additional harrowing. In good ground they accomplish easily from thirty to thirty-five acres a day.

Two men—an engineer, and a steersman who also raises and lowers the cutters—are required, together with a water-hauler; the total expense for which is less than $10 a day. Coal landed at Martinez costs $7 a ton.

The wear and tear consists in sharpening the twenty-four cutters; once for every twenty to thirty acres, at a cost of a bit apiece, and in replacing them with a new set of knives on an average once for every 1,000 to 1,500 acres plowed, at a cost of seventy-five cents apiece, being of cast steel, and containing about $18 worth of steal. In the other parts of the machinery there is no more wear and tear than there would be in ordinary machinery; the motion over uneven ground being so steady as not to do the least damage, and the engine never getting out of order necessarily during an entire season. The wear of the gearing is prevented by means of a flexible joint, which gives way when any hard substance is struck.

The cost per acre, from actual experience, was less than a dollar; the expense for fuel, and for attendance (including water hauling), being about the same, or half a dollar per acre.

As an experiment, alternate widths of fifty feet were plowed with the steam and the ordinary plow, in order to observe the different effect the two kinds of plowing would have upon the crops; and it was observed that owing to the very complete pulverization effected with the former, the soil looked moister, in a spell of drying weather which succeeded the plowing; the consequence being that the steam plow's crops grow faster. The owner of the land, Mr. Kilichor, paid $3 an acre (the ordinary gang-plow price being $2.50), and was so pleased with the work that propositions were made for the purpose of retaining the plow permanently on the place.

In traveling from Martinez to Pacheco—a very hilly and rough road—the plow had to ascend grades of one to six feet; and it has gone through holes presenting one to three feet. Good plowing has been done on one to twelve feet,—though the plow is intended for a level country.

For the gravelly soil at Kilichor's, soft iron knife arms were used, set like a coulter, in such a manner as to twist on striking a boulder, before breaking. Only a few of these were twisted in the course of a day.

The new plow referred to at the Union Foundry is for Mr. Miller, of this city, and is much larger than the present plow, having a working capacity of 100-horse power. It is destined for heavy and continuous service on a large tract of level valley land that will occupy it for the full season.

When harvest time comes, these plows are to be transformed into reapers and threshers, using straw for fuel.

Working up our Cotton into Batting, Wadding, etc.

The Mexican, Tahitian and Sandwich Island cotton, which comes here consigned to Murphy, Grant & Co., Badger & Lindenherger, and others, finds in California an eager and ready market, through the agency of new manufacturing enterprises, which are as profitable to the competent mechanics who are establishing them, as their products are useful and beneficial to the growing populations tributary to our manufacturing centers. Folk & Co., on Brannan street, take this cotton, and put it through the usual cleaning and carding processes, flatten it out into a light and fleecy fabric, which is then usually rolled up into bundles, like any other textile fabric, and sold for batting and wadding, such as tailors and dress-makers know how to use to great advantage in the interior parts of clothing; but here only a part of the batting is so disposed of, the rest being at once worked up, by a number of young ladies with sewing machines, into an article which will illustrate the advantage to all concerned, of establishing local manufactures, viz: quilts, or comforters for beds. Calicoes are bought by the case, the batting is laid between them, and the several parts are welded, in a few minutes, by passing them through the sewing machines, into a fabric as warm as a blanket, and a great deal cheaper, being sold for $20 a dozen. Folk & Co. have ten wadding and batting machines, made at Paterson, New Jersey, six of which are already running, and all the other machinery necessary for carrying on the business in all its branches; employing at present seventeen persons, of whom five are women, four men, and eight Chinamen. Another department of the establishment is devoted to reducing old and worn-out fabrics into their original fibrous state, by the use of burlap machines. This is the road that shoddy takes; but the product here is sold to upholsterers and mattress makers.

MURPHY'S MAP OF THE WHITE PINE MINES.—This is the latest and best executed of the maps of White Pine that has yet appeared, the artist being Vitus Wackenreuder, whose name is a sufficient guaranty of the character of the work. Mr. Murphy himself has the advantage of being familiar with every inch of ground represented; and the map, which is 2½x3 feet in dimensions, contains more circumstantial looking topography, and more mining locations than any of its predecessors; including the locality of the new discoveries to the south of Treasure Hill; Shermantown, and as far as the summit of White Pine Mountain towards the west; Hamilton to the north; and the easterly side of White Pine Valley to the east. From the mining locations as represented, two general directions may be deduced of the deposits of Treasure Hill: one of them in the line of Treasure Hill, or the Nevada Mountains in general, varying from 15° to 20°, *en masse*, according to the locality; the other northwesterly, about in the line of the ridge running to the north and west of Keystone City. Some of the locations on Chloride and Pogonip flats, belonging most nearly to the first named class, vary so much toward the southwest as to look like a spur, and to be entitled, perhaps, to be designated as a third class.

Mining and Chinese Labor.

By a card from the Miners' Union of Virginia City, published in the *Territorial Enterprise* of Saturday last, we see that self-protection in labor is the plea urged by the miners against the admission of Chinese labor into vein mines, where capitul is commanding the services of considerable numbers of white men. "We are determined," says the card, "that side by side with the Chinamen we will not work." Legislative representatives at Carson are asked to defeat the bill introduced for "An Act for the protection of labor," which proposes to punish assaults on Chinese fellow laborers, the same having been called into life by a recent lawless removal of thirty or forty Chinese laborers from Unionville, Humboldt County, by an armed mob. This, we are informed, is to be the "beginning of a conflict that will shake the State to its center."

The truth is that the employment of Chinese labor is one of the marked features, historically, of the development of this coast. By its aid we are passing, at one stride, from an undeveloped state into a permanent producing and manufacturing community blessed with all the advantages and comforts of centuries of civilization. If it is by any design of the author of mankind that gold and silver have attracted hither, by a sudden impulse following their discovery in our ripe age, the Caucassian races that came wandering westward by the Black Sea, then it seems no less strikingly a work of design, rather than of chance, that this Chinese labor has been given into our hands, to command and to direct, for the accomplishment of all the great works that we find we have on our hands to do. If our new commonwealth on the Pacific is destined to play the picturesque part in history that our first twenty years would forecast, not a little of it will be due to the use and the results of Chinese labor; as in the construction of the Pacific Railroad, of the Darien Canal, and of the great network of railroads in China, with its consequences; which are all immediately before us, and so near to us that we can say they belong to the present, rather than to the future.

Let the miners of Virginia City remember that there are Californians claiming the right, and suffered to exercise the privilege, of mining in China, as well as there are Chinese mining in California and her tributary States; that the rule would have to work both ways; and that it has been customary amongst civilized nations to condemn the Chinese policy of exclusiveness, until China herself has recently thrown open her promising fields to foreign enterprise, which is now trying to adapt itself to her conditions. The miners are certainly not afraid of the Chinamen on account of either the physical, or the mental superiority of the latter; so that there is no reason in the world why a Chinaman should not be allowed to have a "fair show," in the doing of work for which he is best fitted, especially when it is only an equally fair and liberal dealing towards Americans, on the part of the Chinese government, that will open to us at the same time an opportunity of doing work for which *we* are especially adapted, and give us the permanent moral ascendency over 388,000,000 of people.

Virginia City and Truckee Railroad. Two railroad bills are pending before the Nevada Legislature, for final action, the one authorizing Ormsby County to give the Virginia and Truckee Railroad Company $200,000 fifteen-year gold bonds, bearing seven per cent. interest, payable by the County Treasurer semi-annually, and the other empowering Storey County to give $300,000 of like bonds to the same company; both of which it is expected will be passed, and that the railroad will speedily become a fact. An order has been sent East for the iron rails.

Quail Hill.

More favorable results are reported, at length, from the pyritiferous talcose slates at Quail Hill, Calaveras County, in which Professor Silliman has been interested. The existence of gold ores disseminated somewhat in the nature of fahlbands, through our Jurassic slates where the auriferous quartz veins occur, was not only a fact of great scientific interest, bearing directly upon the origin and nature of our gold deposits, but of some consequence to those who simply knew, or cared to know, that streaks in the talcose slates in question assayed from $10 to $30. But the metallurgical difficulties which were encountered, have kept the Quail Hill mines under a cloud. Though the ores were limitless as to quantity—a deposit reported to be fifty yards wide at the surface—and so soft that one stamp could crush four tons of it per day, the actual yield from the milling proved only $3 a ton on an average, during ten months trial, and the expenditure, on the other hand, was $200,000. The nature of this metallurgical difficulty, which is now said to have been overcome, can only be inferred from the facts. Amalgamation during these ten months was done in the battery and in copper plates, probably in about the usual manner. The minerals were gray sulphuret of copper, or "fahlerz," an antimonial sulphuret of silver, iron pyrites, copper pyrites, galena, and sulphuret of antimony. As these, especially the fahlerz, have been quite successfully treated from time immemorial in Chili, it would seem that the difficulty was not a necessary one, unless it were caused by the nature of the gangue. Under the new regime the crushed ore was ground for two hours and a half in a Wheeler pan, with some chemicals described as "alkalies;" the mullers were then raised, quicksilver was put in, and the mullers made to revolve for two hours more, the pulp being thick, and kept at boiling heat by steam. The quicksilver is said to be rendered remarkably "clean and lively" by the chemicals, and the chemical action, whatever its nature, is such that but little of the base metal is taken up, the bars ranging from .900 to .973 fine in gold and silver—from .500 to .800 silver, and .030 to .250 gold; the bulk being silver, as is further illustrated by the following table of working results, from different streaks of from six to ten feet in width, as given in the *Alta* of Jan. 22d:

	Silver. Fineness.	*Gold. Fineness.*	*Pounds Worked.*
Purple Streak	.387	661	1,242
Rich Streak	.558	398	2,151
Silver Streak	.281	188	1,855
Lead, No. 1	.285	312	.....
Lead, No. 2	.782	458	.....
Tailings	.731	417	725

The yield of 400 tons worked during the last four months averaged $35 from the mine, and from $10 to $25 per ton for tailings. The large proportion of silver entitles it to rank as a silver mine.

The Earthquake Committee and Earthquake-proof Buildings.—The Sub-Committee on Structural Designs, from the Joint Committee on Earthquake Topics, have reported on the plans submitted to them. All the information that builders may desire, which is in the hands of the Secretaries, embracing plans and specifications of about all the different methods that have been proposed, are at the service of the public, though not yet in published form. Notwithstanding the fact that preference may be given by the committee to some one plan, it is still the privilege of builders to prefer any other amongst the multitude that have been offered. We trust that a liberal compilation will be made of all the facts and phenomena that can be of interest to Californians touching the nature and causes of earthquakes, and that the committee will not stint the publication of the same, with all the necessary diagrams.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

Polytechnic Evening School.

Mr. Frederic Hollert, a graduate of one of the Prussian Polytechnic institutions, as well as of the more practical grade of *Gewerbe*, or mechanics schools, has fitted up a very large and well suited room in the Mining and Scientific Press building, for the purpose of giving personal and verbal instruction, by lecture and by practical illustration, in all of the branches connected with the mechanic arts and trades in the learning of which more than shop experience, and shop instruction, are requisite. This is certainly a most useful institution for San Francisco, and is deserving of the best encouragement that can be given to it especially from master mechanics, and from public spirited citizens who sufficiently understand the subject to appreciate the purposo and value of such practical instruction. The field of instruction embraces nearly everything that mechanics who wish to advance, will find it to their advantage to acquire; but especially mechanical drawing, architecture, construction, the indispensable principles of geometry, strength of materials, machine building, applied mechanics, physics, technological chemistry, etc. Mr. Hellert appears to be very competent; and the oral and personal method of instruction adopted is the sure method by which a large area of neglected ground can be got over in a very short time, while the routine course at the colleges usually requires years. The subject being named in which the student desires to become more thorough, Mr. Hellert defines the nature and relations of the ground to be gone over, furnishes him the names of the best text books, and puts him practically in the shortest road; accompanying him to his goal, and never failing to direct him also to the working world for practical examples. When such opportunities are offered in our midst, no working or thinking mechanic in San Francisco has the right to bemoan his accidental want of a thorough education, for here we have the elements of the best that is to be had in the world. Those who wish to rise in their particular trade by legitimate means, have the road opened to them by which they may attain to a proper degree of competency. The principles of all the sciences, which have been brought into existence by the necessary arts, are very few, and very simple, when given in substance, orally and by illustration, by a clear-minded and competent instructor.

Mr. Hellert's school is open evenings only, and we understand he has quite a number of apprentices now making commendable progress in drawing. Classes in algebra and geometry are to be commenced on the 15th of February, to meet twice a week.

Montana Resources and Developments.—Our correspondent from Helena, whose facile communication, signed "Everywhere," was observed in our last issue, will be heard from regularly, so that the readers of the Press may keep well informed of the resources and developments of that border land, which proposes to play its part with the entire family of the Pacific mining States, in the grander times which are ahead. The writer is a mineralogist himself, in editorial harness, and within fair view of his entire field. He will at the same time act as our agent and business representative in Montana.

Important Projects before Congress. Among the large jobs before Congress are the numerous Pacific Railroads, the Sutro Tunnel, the Osage Land Treaty, the Sandwich Island Commercial Treaty, Indian claims, land grants, State Department purchases, the Niagara ship canal, the Darien Canal, river and harbor improvements, the Yosemite Valley claim, the New Idria quicksilver claim, Tehuantepec and Alta Vela, admission of Colorado as a State, etc.

Mr. Nye has introduced a bill in Congress to encourage and aid the construction of a telegraphic cable between California and China, via Alaska.

Our Office.

The office of the Mining and Scientific Press is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

DEWEY & CO.

No Branch Office.

Our friends and patrons will bear in mind that we have no branch office in San Francisco, our U. S. and Foreign Patent Agency rooms being suitably arranged with our Mining and Scientific Press printing office, at No. 414 Clay street. We have no partners in business except the undersigned. DEWEY & CO.

A. T. DEWEY. W. H. EWER.

Returned.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M Taylor, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

A Short Engagement.—The person who visited Yuba, Sierra, and Plumas counties, last fall, as agent and correspondent of the Press, only continued a short time in that capacity.

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

PAIN KILLER.

No article ever attained to such unbounded popularity.—*Salem Observer.*

An article of great merit and virtue.—*Cinn. Nonpareil.*

We can bear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch.*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Tenn. Organ.*

It has real merit; as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*

It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.* 26v17-1m

PACIFIC

Rolling Mill Company,

SAN FRANCISCO, CAL.

Established for the Manufacture of

RAILROAD AND OTHER IRON

—AND—

Every Variety of Shafting,

Embracing ALL SIZES of

Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames

—ALSO—

HAMMERED IRON

Of every description and size.

☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.

☞ The highest price paid for Scrap Iron. 9v13m3p

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods.

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pour rings.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

1v18-3m9p 519 Front street, San Francisco.

PATENT RIGHT

—FOR—

MANUFACTURING PROOF SPIRITS

FOR SALE.

Attention is called to MARTIN'S NEW PATENT for a process for Distilling Alcohol (85 per cent. or higher), without rectifying, which is offered for sale on favorable terms. Samples may be seen, and further information obtained, at No. 423 Washington street.

26v17 E. M. DEWEY.

Quartz Mill Amalgamating Plates, Electro-Plated with Fine Silver; also Instructions in Gold and Silver Plating, on hard and soft metals. EUREKA PLATING WORKS. Terms moderate. 126 Kearny street, between Post and Sutter sts. 4v18 3m

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight: without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 13v16tf

WILLAMETTE IRON WORKS,

PORTLAND, OREGON.

Steam Engines, Boilers,

SAW AND GRIST MILLS,

MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

Corner North-Front and E streets,
18v13-1y One block north of Couch's Wharf.

Globe Iron Works,

STOCKTON, CAL.

KEEP & BARGION,

MANUFACTURERS OF

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,

High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

J. NEWSHAM. J. BIGWOOD.

SOUTH BEACH IRON WORKS,

Near corner of King and Third streets, San Francisco.

MARINE ENGINES,

AND ALL KINDS OF

MACHINERY FORGING.

All kinds of Ship-smithing and Mill work manufactured to order. Jobbing of every description promptly attended to. All work done guaranteed. 13v14-1y

CALIFORNIA BRASS FOUNDRY.

No. 125 First street, opposite Minna,
SAN FRANCISCO.

ALL KINDS of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

PRICES MODERATE.

J. P. GALLAGHER. J. H. WEED V. KINGWELL.
9v13-1y

Miners' Foundry

—AND—

MACHINE WORKS

Nos. 245 to 255 First Street,
San Francisco.

HOWLAND, ANGELL & CO.,
PROPRIETORS,

Manufacturers of Machinery for

QUARTZ MILLS,	FLOUR MILLS,
SAW MILLS,	SUGAR MILLS,
POWDER MILLS,	PAPER MILLS

Steam Engines of all Kinds.
Amalgamators of all Kinds.

MINING PUMPS,	HOISTING WORKS
OIL WELL TOOLS,	ROCK BREAKERS,

—AND—

Machinery and Castings of all kinds, either of Iron or Brass.

Boilers and Sheet Iron Work in all its Branches.

Shoes and Dies of White Iron, manufactured for and imported by us expressly for this purpose, and will last 25 per cent. longer than any other made on this coast.

Russia Iron Screens, of any degree of fineness. We are the only manufacturers on this coast of the

HICKS ENGINE,

The most compact, simple in construction, and durable, of any Engine in use.

FULTON

Foundry and Iron Works.

HINCKLEY & CO.,

MANUFACTURERS OF

STEAM ENGINES,

Quartz, Flour and Saw Mills,

Hayes' Improved Steam Pump, Brodie's Improved Crusher, Mining Pumps, Amalgamators, and all kinds of Machinery.

N. E. corner of Tehama and Fremont streets, above Howard street, San Francisco. 3-qy

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

Swedenborg as a Scientist.

Dr. Percy, than whom there is perhaps no better authority upon the subject of metallurgy, says, that although "the metallurgical works of this remarkable man seem to be very imperfectly known," none are in his judgment "more worthy of the attention of those interested in the history of metallurgy." These works constitute the second and third volumes of a series of three published in 1734, entitled *Opera Philosophica et Mineralia*. The *first* of the three, however, is of less practical or at least demonstrable, character. Its title is as follows: *Principia, or the first principles of natural things, being new attempts towards a philosophical explanation of the Elementary World.* The following summing-up of the contents of the work is from a notice, in the *Chemical News*, of White's life of Swedenborg:

The *Principia* is an endeavor to explain the origin and method of creation. Nature is asserted to start from "points of pure and total motion produced immediately from the Infinite," which motion is said to be vortical.

From the congress and compression of points are formed what he calls first finites, revolving on their axis under the impulsion of their constitnents; in this respect perfectly resembling the earth, although in comparison with the least things visible they are quite inappreciable.

Out of the first finites by still further compression are formed second finites, which are said to constitute the first element, filling the whole space of the stellar heavens and composing the solar vortex.

From second finites by yet further compression are produced third finites, which constitute the magnetic element.

Again third finites are compressed into fourth finites, or the third element called ether.

Ether under further compression becomes air, and air compressed becomes water, and water under similar treatment yields salt and all minerals.

Such, according to Swedenborg, is the derivation and possession of the elements. Derived from the original point is a ceaseless motion, whereby all subsidiary matter is maintained in vortical whirl.

For the confirmation of the theory he turned to the phenomena of magnetism. Prof. Musschenbroek, of Dortrecht, had published in 1729 *Physica Experimentales et Geometricæ Dissertationes* abounding in magnetic observations. These Swedenborg freely transferred to his pages, and applied them in proof of vortical motion. Musschenbroek held that magnetic attractions and repulsions observed no certain laws; Swedenborg on the contrary maintained that nowhere was order more demonstrable.

A cardinal principle with Swedenborg was the uniformity of creation—that size makes no difference; that the method of nature is everywhere the same; that the energy that shapes a dew-drop shapes a world; that the mechanism of an elephant's trunk and a fly is the same. This truth he considers of inestimable value, because by analogies drawn from the seen we may predicate the unseen, and deal with it as though it lay under our eyes.

Consistently, then, he applies his doctrine of atomic to cosmic creation. Suns are sires of systems; suns therefore consist of points of motion produced from the Infinite. The condensation of these points result in ether, which thrown off from the sun, breaks by attenuation, and collapses in plants; which spheres of ether by slow degrees condense to air, to water, to salt, to *terra firma*.

ATMOSPHERIC ROASTING AND DECOMPOSITION OF REFRACTORY ORES.—The Colorado City *Herald* says:

It has been proved by actual experience, that ore which has been exposed to the weather for a long time, is more easily treated. Ore from the Fisk and Gregory, which would hardly pay for milling, has been known to pay handsomely, after having been exposed to the weather for five or six months. In other mining countries, Russia for instance, ores similar to ours are exposed to the frost, rain and sunshine for years, and it has proved to be one of the most economical modes of getting rid of the refractory characteristic of the ore.

Weathering ores is a very common metallurgical process in all of the European mining countries.

THE ICE MACHINE OF M. CARRE.—This machine operates upon the principle that when a liquid substance, by removal of pressure, is forced to assume a gaseous condition, it will absorb heat. It consists of two vertical cylindrical vessels, of different size, at their upper ends connected by a tube; they are made of strong sheet iron; the largest of them has double sides, the space between them being hermetically closed, and at its upper part connected by means of a strong tube, with the upper part of the second smaller vessel, which is a simple upright cylinder and also hermetically closed; the vessel is filled with a strong solution of ammonia in water, or the so called *aqua ammoniæ fortior*. By the heating of this vessel the ammoniacal gas is driven out of the water, and if the double-sided vessel, at the same time, is placed in cold water, the pressure of the developed gas, will be sufficient to liquefy the gas itself between the double walls of the large vessel. As soon as this is accomplished, the apparatus is ready to commence the freezing operation, the water to be frozen is placed in a proper vessel of a thin well conducting metal closely fitting in the open space inside the double-walled larger cylinder, between the walls of which the ammoniacal gas has now been liquefied by the pressure produced by heating the smaller vessel. This smaller vessel being hot, is now suddenly plunged in cold water, the water confined inside which first had its ammonia expelled by heat, regains at once by means of the cold applied to it, its most intense affinity for this gas, it will absorb it with great rapidity, the liquefied gas in the larger vessel will be relieved from the pressure which brought and kept it in the liquid state, and it will consequently readopt the gaseous form, distil over as it were, to be condensed in the water of the smaller vessel, and this forced evaporation in the larger vessel, will be productive of such an absorption of heat from this vessel and the water contained in its center, that this water will rapidly be frozen to a very hard solid cylinder of ice. The above is from an article in the *Scientific American*.

A REMARKABLE MOUNTAIN OF SALT.—In the Pahranagat District, which lies in the southeastern part of the State of Nevada, about 180 southeast of Austin, is a remarkable mountain of pure salt. In small pieces it is quite transparent, and so remarkably hard as to require blasting. It is five miles in length, 600 feet in hight, and of unknown depth.—*Ross Browne's Report.*

WOOD CHOPPERS.—The Pacific Railroad Company has about 1,000 men employed chopping wood on the mountains in the vicinity of the Humboldt Wells. It is worth $8 per cord along the line of the road out that way.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco.
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to

Engineering.

[Written for the Mining and Scientific Press.

Concrete and Concrete Buildings.

The New York Society of Practical Engineering held its regular fortnightly meeting at the Cooper Institute Building, on Tuesday evening, January 5th; the President, Mr. James Whitney, in the chair. Wm. B. Harrison, Recording Secretary.

The subject for the evening was "Concrete and Concrete Buildings," and a paper on that subject was read by Mr. Charles Rogers, of New York city. The writer first spoke of the use of mortars, cements, etc., among the ancients. The Egyptians he regarded as among the first who carried the use of mortars to any degree of success. The mortar of the pyramids is a sample of the material used by this ancient people. The works of the Egyptians have proved more durable than those of the Romans, built in the same country, showing their superior skill. In Rome we find many of the great ancients are writers on architecture. As to hydraulic operations, the works of the Romans were very differently constructed from ours. The properties of our hydraulic lime, however, must have been wholly unknown, for we know that in the construction of bridges, the coffer dam in which the piers were built, were kept empty of water for at least two months after the masonry was laid, so as to give the mortar time to set. The Roman mortars were composed with few exceptions of pure lime mixed with fragments of bricks coarsely pounded. Such a mortar was used also for hydraulic purposes. The solid substances probably hastened the dessication of the mortar, concrete and *beton*, great materials of modern times, are now regarded as the same thing, at least for practical purposes. Formerly the terms were not considered synonymous. The names are now applied to a mixture of mortar (generally hydraulic mortar) with coarse materials, such as gravel, pebbles, shells, or fragments of stones. The proportions of mortar in concrete should be determined in accordance with the principle, that the volume of the voids in the coarse materials should always be somewhat less than that of the mortar. Fat lime concrete has been shaped into large blocks to be used in walls, like ashlar work. English architects manufacture their concrete by reducing the thoroughly slaked lime to a pulp, and making it into a mortar with the sand, before the coarse materials are added. In the United States the base of concrete mortars is almost always a natural hydraulic cement, to which a paste of fat lime is sometimes added. Here it is used as soon as made. Concrete has been put to every important use,—as a foundation in light and springy soils, for buildings. For submarine masonry, it has received extensive application, being regarded as a reliable substitute for bricks, and sometimes for stone. It has been used for the walls and floors of cisterns, and for the backing of walls faced with brick, rubber and ashlar work. Single ornamented, monolithic masses have been made of concrete. Concrete houses have been built in the United States and Europe with hollow walls, and the practice is daily receiving more attention. Their advantages are, that they afford safety, or rather, a partial safety in case of fire, and give an opportunity for managing the fire, smoke, and ventilating flues. They also secure a partial equality of temperature during extremes of weather. Concrete as applied to sewerage and drainage purposes, was spoken of, and the manner of making pipes of this material described.

Prof. Wm. Robinson.—The setting or drying of mortar may be attributed to two causes, evaporation and chemical combination. The principal cause is the former. In one of the citadels of Europe which has been standing for 156 years, mortar has been found in the interior as soft as the day when it was laid. Hydraulic limes are principally composed of a mixture of lime with clay. Caution must be exercised in the calcination, as too high a temperature injures the materials. No more heat is required than is sufficient to expel the carbonic acid. The power of resistance to rupture in the case of pure hydraulic cement is equal to fifty-four pounds per square inch. This power decreases exactly in proportion as sand is added.

The President.—The manufacture of artificial stone (familiar to the readers of the PRESS) is perhaps one of the greatest advances in this branch of modern industry. There is also a German invention in which carbonate of lime and sand are mixed with caustic lime, forming a mortar.

Mr. Parmelee.—A concrete ship must certainly be the last application of concrete. I saw a few days since a ship in which the steel plates which formed the hull were lined with concrete to the thickness of four inches.

COMPLETION AND PROFITS OF BUILDING THE PACIFIC RAILROAD.—The report of Mr. J. L. Williams, Government Director of the Union Pacific Railroad, is printed the New York papers. He estimates that by the 4th of July next, the Central Pacific and Union Pacific Railroads will have met at Monument Point; but the Central Pacific has been gaining distance recently, and will probably force the junction to a point farther east, at or near Ogden City. Mr. Williams is a practical engineer, and estimates the profits to contractors upon the Union Pacific Railroad at $14,000 to $16,000 per mile, or a total to the stockholders—who are at the same time the contractors—of not less than $16,000,000.

LIGHT HOUSES AND REFUGE STATIONS IN MID OCEAN.—It is proposed that large iron buoys be anchored below the surface in the middle of the Atlantic Ocean, out of the reach of currents or surface storms, and used as foundations on which light-houses could be built. Some plan similar to this was suggested many years ago by a brother of Prof. Morse; and it is revived by a writer in the New York *Herald* in commenting on the fact that one of the boats which left the sinking steamer Hibernia has reached the coast of Ireland after a voyage of nearly 700 miles, during which the majority of the passengers died from privation and exposure.

TIDAL OBSERVATIONS AND TIDE LAND SURVEY.—G. F. Allardt, C. E., and a corps of ten assistants, are engaged, in continuation of work undertaken for the State Tide Land Commissioners, between Black Point and Fort Point, following the line of twenty-four feet water at low tide; pursuing the same thorough system of tidal observations and soundings which was followed in the survey recently completed of the southern portion of the city and county.

CLEANING OUT THE SAN JOAQUIN FOR NAVIGATION.—Capt. Woodruff, of Sacramento, is now engaged, with the steamer Rainbow, in clearing the snags out of the San Joaquin River, at the same time removing all the overhanging trees; the estimated cost of which will reach $40,000. The steamer's rigging for hoisting snags will raise a weight of forty tons, and the force employed is twenty men.

STOCKTON AND TULARE RAILROAD.—On the 20th inst., Mr. Kidder, engineer of the Stockton and Tulare Railroad, and a corps of assistants, commenced the work of surveying this road. The point of beginning was a short distance south of Mormon Slough. The company have purchased from Captain Weber several blocks of land on the south side of Mormon Slough as a site for a depot, machine shops, etc.; in addition to which Capt. Weber has donated to the company an improved and valuable tract—the company being required to pay for the improvements only.

CABLE LAYING TO THE "ENDS OF THE EARTH."—An English admiralty surveying vessel is now employed in surveying a route for a telegraphic cable between Java and Australia—which means telegraphic communication between Australia and Europe, an extension being likely to be made from Java to Singapore, Ceylon, and Point de Galle. The lines about to be laid down between the China ports, are to be joined to the American and European line.

THE Willamette is to be bridged at Portland, Oregon, by the corporation of that city.

[Written for the Mining and Scientific Press.]

What They are Doing at New Almaden.

THE FURNACES.

EDITORS PRESS:—Seven large furnaces, employing fifty men in the manipulation of the ores, and five hundred men under ground, constitute the present operating and working forces at the Hacienda—the first place you come to after leaving San José, and thirteen miles distant. The furnaces hold from forty to fifty cars full, of 300 pounds each, of ore, and make from four to five campaigns per month. The condensing chambers and chimneys run up on the side of a hill, to a hight of 175 or 200 feet, where the white smoke issues, killing all the grass around.

I observed that some of the men working about the furnaces were trembling, and was informed that one of the boys had just been taken to San Francisco for the hospital.

Root's patent blowers furnish the blast to melt the ores; running day and night, of course, until the campaign is ended.

SODA SPRING WITH PLENTY OF CARBONIC ACID.

There is in the yard of the New Almaden works a soda spring, belonging to the company, which shows an unusually large quantity of carbonic acid, and furnishes a very fine drink indeed. I understand it has been leased for five years to Mr. F. L. A. Pioche, the banker, on Montgomery street. This water is claimed to be the best soda water in the State, in virtue chiefly of its carbonic acid.

THE MINES

Being only 1,000 feet distant, all the ore comes down in cars, and is dumped in at the top of the furnaces—the metal flowing out through a pipe at the bottom, into kettles. They are very particular here about entering the mine. I obtained a permit through the favor of Dr. J. E. Mayo, the Superintendent. The mine has been paying constantly since 1846. Inside I found some Mexicans employed still in packing up ore on their backs. Two blacksmiths were working away there. In some places the chambers are fifteen to twenty feet high, and ten to twenty feet wide. All of the ore is taken out at the main shaft; and there are twenty-five Mexicans engaged at breaking and sorting.

The miners work by contract, from thirty to fifty in a company. They are either Spanish, or Englishmen.

For hoisting, there are three engines in the mine, of 24, 18 and 16-horse power, driven by steam generated in four boilers outside, and conveyed into the mine through pipes.

This being my first visit here, I will venture to state my impression that these mines are quite a curiosity, for anybody to visit.

THE GUADALUPE QUICKSILVER MINE,

Eight miles from San José, is passed on the way to San José. James F. Brown is the Superintendent, and there are fifty men employed throughout. The shaft is in a valley near the creek, and is 400 feet deep. Next week twenty more men are to be set to work. Yours, etc., W. H. M.

San José, Jan. 20, 1869.

A GOOD ENTERPRISE.—William H. Toby & Co., advertising agents on the San José and Gilroy railway route, and now acting as commission and purchasing agents for the people along the line. This is a decided convenience. The many benefits of the railroad system are beginning to be better appreciated in California, and we hope soon to have local roads running in every direction, as they are to be found throughout the Eastern States.

BASE METAL ORES IN IDAHO.—Guido Kustel, the metallurgist, is engaged at the Rising Star mine, Flint District, Idaho, in introducing his base metal lixiviation process, for the treatment of the gray copper (fahlerz) and other cupriferous ores encountered in that mine, before subjecting the pulp to pan amalgamation.

HENRY CAREY BAIRD,

Industrial Publisher,

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting with Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **6th, 14th, 22d** and **30th** of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR JANUARY, 1869.

The following Steamships will be dispatched on dates as given below:

January 6th—SACRAMENTO.....Capt. W. H Parker, Connecting with ALASKA, Capt. Gray

January 14th—MONTANA.....Captain A. We Connecting with RISING STAR, Capt. King.

January 22d—CONSTITUTION.....Capt. Wm. H. Hudson Connecting with HENRY CHAUNCEY, Capt. Connor.

January 30th—GOLDEN CITY.....Capt. W. F. Lapidge, Connecting with ARIZONA, Capt Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained Orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—If desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Hoane, will be dispatched on MONDAY, January 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

IMPROVED INNER SOLES

—FOR—

BOOTS AND SHOES.

Those who have worn Daggett's Patent Elastic Ventilating Inner Soles, are unanimous in testimony that the correct principle has been fully found and reduced to practical and successful use. The foot rests upon a cushion of air cells between points of vulcanized rubber, every cell opening freely into each other and through the space occupied by the foot. There is no contact of the foot with the wet bottom of the boot. The elastic points sustain the weight of the wearer, leaving an air space always, between the foot and all dampness. Every step compresses and restores the air chambers, thus constituting hundreds of air pumps at every step of the foot.

The rubber points will not absorb the moisture from the boot, so that the soft flannel which covers them is always dry. Their springing elasticity renders them of peculiar value to the aged and infirm, who feel the jar of walking upon hard substances, also to all persons whose business requires much walking or standing.

These soles are affording great relief to persons afflicted with rheumatism and consumptive complaints, chilblains, corns, cold and sweaty feet.

For warm and dry feet use the Patent Elastic Ventilating Inner Soles.

No. 13 Exchange Street, Boston, Oct. 15, 1867:—This may certify that I have used the Patent Elastic Ventilating Inner Soles, through the spring and summer past, and have found them to be the best contrivance for keeping the feet dry and comfortable, that I have ever used, and for any one having corns or tender feet, the best article ever invented. CHARLES K. DARLING, Stationer.

Patent Elastic Ventilating Soles—If you wish a comfortable article for your feet, a real luxury in cold weather, obtain a pair of the Patent Elastic Ventilating Inner Soles. Having used these soles the past winter, we can safely recommend them as tending not only to promote the comfort of the feet, and ease in walking, but also the equalization of the temperature of the feet, which renders them almost invaluable.—[Boston Traveler, Oct. 1867.

Price, per pair, **$1.** By mail, postage paid, **$1.25.** For sale by PATRICK KELLY, No. 327 Bush street, San Francisco. 3v1tf

---

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and reverse laws as well as other new and imperative regulations. These disrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Metallurgical Statistics.

We are informed by the managers of the Columbia College School of Mines, that it is proposed to establish in connection with their metallurgical department, a Bureau of Statistics, relating to the working of different ores in this country, similar to the Bureau of Mineral Statistics connected with the Government's School of Mines in London, the following circular, relating to the manufacture of cast iron, being the first of a series:

NEW YORK, Dec. 8th, 1868.

Dear Sir:—The School of Mines is engaged in collecting statistics of the blast furnaces of this country, with a view of having, in the city of New York, some place where reliable information can be had with regard to the working of iron in this country.

These statistics will be used to establish general principles, which will be announced in the Lectures on Metallurgy. The details of your own furnaces will be considered confidential, and will not be communicated if you desire it.

It is quite important to know the general form of the furnace, whether it is egg-shaped, the curve being continuous or whether it is made up of straight lines. The practice in this respect is very different, in different districts. You will greatly oblige me if you will give a sketch of your furnace and also fill up the following table and transmit it to the School of Mines.

Yours, respectfully,

THOS. EGLESTON, JR.

Prof. of Mineralogy and Metallurgy.

Name of the works; town; county; State; proprietors; number of furnaces: total hight; hight of bosh; hight of the hearth; hight of the tuyeres; diameter of the throat; diameter of the bosh; diameter at the tuyres; number of tuyeres; diameter of tuyeres; hot or cold blast; temperature of the blast; pressure of the blast; kind of ore; yield of the ore; kind of iron—white, gray, or mottled; kind of fuel; quantity of fuel per ton of cast iron; production of each furnace, in tons of 2,240 lbs. by 24 hours.

The idea is worthy of every encouragement.

NEW SUTRO TUNNEL BILL.—This enterprise has been brought before Congress this session by Mr. Ashley, in the shape of "A bill to aid in ascertaining the value of public lands containing mineral lodes, and for the endowment of a National School of Mining." The bill is a modification of the one which last session received the sanction of the House Committee on Mines and Mining, being changed so as to meet the supposed present temper of Congress in relation to subsidies. It is now proposed that the Government, instead of issuing its own bonds in favor of the enterprise, shall guarantee the payment of the principal and interest of bonds to be issued by a Tunnel Company (to be hereafter constituted, the assignee of Mr. Sutro and his associates,) such guarantee to be exteuded to the amount of $5,000,000 principal and 6 per cent. interest for the term of thirty years, when the bonds are to be payable in United States currency.

ABATING.—The small pox is rapidly on the decrease in San Francisco, and we now hear less about it here in this city than our friends do in the interior. Parties in the country properly vaccinated, need have no reluctance about coming to this city. Without that precaution they are unsafe in any portion of the country.

LOWER CALIFORNIA.—Petermann's "Mitheilungen" in Gotha publishes a map of Lower California, from the explorations made by J. Ross Browne, Gabb and Loehr. An account of the journey, with interesting geological details, from the pen of Herr Gabb, is added.

WORK on the Western Pacific Railroad is progressing at such a rate as to effect its completion by the time that the junction between the Union and Central is made at Salt Lake—about April 1st, according to calculations.

THE VELOCIPEDE fancy manifested itself during the week in fresh orders for French two-wheeled fore-and-aft machines, at Palmer, Knox & Co's Foundry; and in numerously attended practicings at the Mechanics' Pavilion.

CHINESE SULPHURETS.—A sample of ore sent down from the Pingtu Digging, has been analyzed by a gentleman at Hongkong, and found to be a rich oxide of antimony associated with sulphurets of iron, zinc, and lead. The proportion of silver is too small to be worth extracting. The ore is, nevertheless, valuable.

LARGE STEAM ROLLER.—A fifteen-ton steam roller is ordered for the New York Central Park. It is to be made by Aveling & Porter, of Rochester, who have already filled a similar order from Philadelphia.

THE *California Medical Gazette* contains a paper by Dr. Shorb on the Miasmatic Diseases of California; an article on the Small pox Epidemic, by Dr. Morse; and editorials on "Our Great Mortality," and "Hospital Investigations."

Read and Subscribe.

With the advantages of past experience, the increased patronage and friendly support of the intelligent and progressive readers of the Pacific States and Territories, we are confident in asserting that the new volume of the MINING AND SCIENTIFIC PRESS, commencing with 1869, shall be in all respects superior to its predecessors. Of the past, we will give the written

OPINION OF OTHERS:

EVERY miner in the community should subscribe for the Mining and Scientific Press.—*Grass Valley Union.*

MINING AND SCIENTIFIC PRESS.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec. 19.*

THE MINING AND SCIENTIFIC PRESS has become almost indispensable to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 10th.*

THE *Mining and Scientific Press* is one of the best papers of the kind ever published, and to California miners, especially, it has become an almost indispensable requisite for the successful prosecution of their calling.—*Nevada Gazette,*

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth volume. It has donned a new style of hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger. July 18th.*

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town solicitiug subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books. *Nevada Gazette.*

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

MINING AND SCIENTIFIC PRESS.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, but more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

A USEFUL PUBLICATION.—The MINING AND SCIENTIFIC PRESS, published at San Francisco by Dewey & Co., is a publication valuable to all classes and indispensable to miners and inventors—the patents for nearly all California inventions having been secured through the Patent Agency of the proprietors of that paper, and the inventions themselves brought into notice through its columns. We are glad to learn, from Mr. Wm. H. Murray, the traveling agent of the paper, who dropped in upon us Monday evening, that its merits are so well appreciated; and we unhesitatingly commend both the paper and its gentlemanly agent to the confidence and patronage of scientific and practical men of all classes and every occupation.—*Solano Herald.*

THE MINING AND SCIENTIFIC PRESS, of this city, has done us the honor to notice us in their columns, and we feel in duty bound to acknowledge the compliment.

It were fruitless for us to say anything in praise of the MINING AND SCIENTIFIC PRESS. * * * It speaks for itself wherever it goes. Its editors are men of intelligence, ability and honor.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

SUBSCRIPTION TERMS, in advance, $5; six months, $3. Specimen Nos. of the paper and Circulars of Information for Inventors, sent free on application.

SPECTACLES.—Muller, 205 Montgomery street, is selling large quantities of his celebrated spectacles, which give universal satisfaction.

New Mining Advertisements.

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of January, 1869, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty seventh day of February, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventeenth day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J. CROWNINSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. jan30

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of January, 1869, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 426 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth (5th) day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirtieth (30th) day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

R. N VAN BAUNT, Secretary.

Office 426 Montgomery street, San Francisco. jan30

Mining Notices--Continued.

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of January, 1869, an assessment of two dollars ($2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M RUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. jan16

North American Wood Preserving Company.

Location of Works: San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the fifteenth day of January, 1869, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the Company's office, 430 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of February, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. Byorder of the Board of Directors.

WM. B. LAKE, Secretary.

Office, 430 Montgomery street, San Francisco. jan16

Patrocina and Dolores Silver Mining Company, Cuazapares District, State of Chihuahua, Mexico.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the ninth day of December, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

jan9 ENOS TAYLOR, Secretary.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

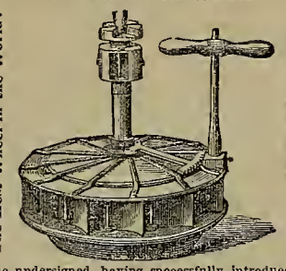
No. 53 Beale Street, bet. Market and Mission,
SAN FRANCISCO.

Files Re-cut and warranted as good as new, with a saving of fifty per cent. REAPER AND MOWER SECTIONS MADE TO ORDER. The only establishment on the Coast. Orders from the country promptly attended to. ☞ First Premium awarded at the State Fair, 1867.
2v17-3m **T. G. DUNNING & CO**

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Patent for Sale.

The Best Wheel in the World!



Triumphant in every Test with all other Wheels!!

The undersigned, having successfully introduced the **Leffel American Double Turbine Water Wheel**

On this Coast, and owning the Patent for the whole Pacific Coast, viz: The States of California, Nevada and Oregon, and the Territories of Arizona, Washington, Idaho, and Western Montana, wishes now to dispose of the Patent, with stock of Wheels on hand, Patterns, etc., etc.

A Company organized and prepared properly for the construction of these Wheels, to supply this Coast and all tributary countries, could make the business immensely profitable.

My object in selling is to enable me to devote myself exclusively to my profession. A. MYERS.

P. S.—If not sold previous to February 15th, then I would enter into an arrangement to manufacture by paying royalty. Address Rev. A. MYERS, Portland Oregon.

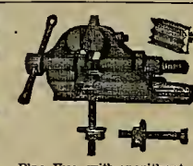
Standard Milling Machine.



Pipe Vise, with or without Extra Jaw.

UNION VISE COMPANY,
OF BOSTON, MASS.

Extra jaw, and heavy Vises, Warranted for heavy work. New style Wood and Covered Screw Vises, forty styles and kinds; Standard Milling Machines, simple, great capacity, power and strength—two sizes, large, 2,300 lbs; small, 950 lbs. For sale by the trade.
23v16-1y G. H. NOTT, Pres.

CALIFORNIA TOOL WORKS,
Blacksmith and Machine Shop,
HAS REMOVED
To 143 Beale St., bet. Mission and Howard,
SAN FRANCISCO.

All kinds of Edge or other Tools made to order. Imported Tools, if too hard or soft, re tempered to give satisfaction. REAPER AND MOWING KNIVES; complete sections always on hand, or will be made at the shortest notice. Particular attention paid to putting in order AGRICULTURAL MACHINERY. Job Grinding and Polishing by steam. Orders from the Country promptly attended to. ☞ All work warranted. Prices reasonable.
21v17-qy **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom bubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the flour hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Portable Engines.

The Swamscot Co's (warranted equal to any manufactured, may be seen in use in this city), PORTABLE and STATIONARY STEAM FIRE ENGINES, STEAM PUMPS and ROTARY PUMPS, and WOOD-WORKING MACHINERY of every description, at Eastern prices. Address W. O. M. BERRY & CO., **511** California street, San Francisco.
26v17-3m

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and languages; is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send thither, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Montgomery Block. Prompt action is necessary.

DAVID R. SMITH,
Civil and Mechanical Engineer.

Factory on Kingsstreet, between Third and Fourth street.

New roofs covered and leaky roofs repaired, in thorough and substantial manner, promptly and at very reasonable rates. Proprietors of Eagan's Patent. 18v17tf

Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pin dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Our Patent Agency.

THE PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this Coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this Coast.

CHLORINE IN GOLD REFINING.—The following is a new process by F. B. Miller, F. C. S., and Assayer in the Sydney branch of the Royal Mint. It is considered a noteworthy improvement, and will probably soon be adopted by the English assayers:

A French clay crucible is saturated with borax by immersing it in a hot saturated solution, and drying. The gold is then melted in this crucible with a little borax, and a stream of chlorine gas is allowed to pass through it by means of a clay tube (a tobacco-pipe stem was found suitable). The chlorine generator is fitted with a safety-tube seven feet long, and is connected with the clay tube by a caoutchouc tube. In a few hours the whole of the silver is converted into chloride, which floats on the gold. The borax prevents the absorption of the chloride by the crucible, and also its volatilization, except in very minute quantities. As soon as the gold has become solid, the still liquid chloride of silver is poured off, and the gold is now found to have a fineness of say 993 parts in 1,000. The apparent loss of gold is very little greater than is found in ordinary gold melting—being 2·9 parts in 10,000—whereas in the ordinary process it is 2. A small sample of the gold is removed, from time to time during the operation, by means of a piece of tobacco-pipe used as a pipette. This is rapidly assayed approximately, and thus the progress of the operation is judged of.

The fused chloride of silver obtained as a slab after the operation, is reduced by placing it between two plates of wrought iron in a bath of dilute sulphuric acid. The spongy silver so obtained contains gold, which may be separated by nitric acid. The nitrate of silver can of course be precipitated as chloride, and subsequently reduced. The gold appears to be present in the chloride of silver in the form of a double chloride, and the author has succeeded in separating it directly from this combination by precipitation by metallic silver.

LET NO MAN ASK FOR LEISURE.—The most fallacious ideas prevail respecting leisure. People are always saying to themselves: "I would do this, and I would do that, if I had leisure." Now there is no condition in which the chance of doing good is less than in the condition of leisure. The man fully employed may be able to gratify his good disposition by improving himself or his neighbors, or serving the public in some useful way; but the man who has all the time to dispose of as he pleases, has but a poor chance indeed of doing so. To do, increases the capacity for doing; and it is far less difficult for a man who is in a habitual course of exertion, to exert himself a little more for an extra purpose, than for the man who does little or nothing to put himself into motion for the same end. There is a reluctance in all things to be set agoing; but when that is got over, then everything goes sweetly enough. Just so with the idle man. In losing the habit, he loses the power of doing. But a man who is busy about some regular employment for a proper length of time every day, can very easily be something else during the remaining hours; indeed the recreation of a weary man is apt to be busier than the perpetual leisure of the idle. As he walks through the world, his hands hanging unmuffled and ready by his side, and he can sometimes do more by a single touch in passing, than a vacant man is likely to do in twelve months. Let no man cry for leisure in order to do anything. Let him rather pray that he may never have leisure. If he really wishes to do any good thing, he will always find time for it, by properly arranging his other employment.—*New York Ledger.*

OREGON LIME CEMENT.—Excellent specimens of lime cement, iron ore and stone coal are obtained from quarries on Butte Creek, Clackamas County, about twelve miles from Belpassi; within a radius of half a mile, easy of access, with a good road leading to within a few rods of the locality Mr. Frank Cooper sold last summer 1,500 barrels of cement made at this quarry; and a large brick building was erected in Silverton, using this material. The lime rock seems to be composed entirely of shell, and is said to produce an excellent cement that sets quickly, and will withstand long exposure.

QUARTZ MILLS AND DITCHES IN OREGON. There are in Oregon 21 quartz mills, supplied with 140 stamps, and a large number of arastras, the cost of the whole having been about $160,000. The extent of water-ditching reaches 165 miles—cost $275,000. About one-half of the quartz mills in that State are driven by water, being a larger proportion than in California or on any other portion of the Pacific coast.

PRACTICAL AND SCIENTIFIC.—A science is nothing more nor less than a general rule for obtaining desired information, and it is evident that the person who possesses facts in the greatest number and variety is in the best position to invent means of obtaining his information. In mechanical and civil engineering, men are often called upon to decide upon the strength, or what is equivalent thereto, the dimensions necessary to give to a certain piece in a machine or structure, in order that it may properly perform its duty. If there has been no machine of a similar character built previously, the dimensions must be either guessed at or calculated. The scientific engineer is able to do the latter. Supposing the parts whose dimensions are required to be a rod or bolt, he would first calculate the strain which would come on the bolt; he would then decide under what amount of strain the material of which his bolt is to be made would be safe, and by means of these two quantities it would be easy to determine the proper size of his bolt. This is a very simple case, but the more difficult ones are nothing more than a combination of simple cases.

It is hard to draw a line between the practical and the scientific man. Each of them uses the knowledge and facts at his command in attaining the ends which he desires. One great difference between the practical and scientific man, lies in the ability of the latter to take new steps and perform operations which are entirely new; whereas the former is, as a rule, confined in his practice to repeating the operations of others, or in simply making a slight alteration.—*American Artisan.*

NEW USES FOR MICA.—M. Puscher lately drew the attention of the Industrial Society of Nuremberg to the Siberian mica, which occurs in very fine plates, and indicated some new purposes to which it could be applied. When the thin plates of mica are cleaned with concentrated sulphuric acid, and silvered in the same way as glass, they take a luster similar to that of silver, and, being pliable, they can be employed in the covering of various ornaments. By heating the thin plates, and afterwards exposing them for a very short time in a muffle heated to bright redness, an aspect of matted silver is given. It is necessary to avoid heating the mica too long or too powerfully, since in either case a yellow shade is communicated, as well as great brittleness. The silvery substance formed is distinguished from metals by the property of resisting nearly all reagents; it is not in the least altered by sulphureted combinations, by the sun, water, air, concentrated acids or alkalies.

THE FUTURE CITY OF PUGET SOUND, at which the railroad from Columbia river will terminate, has not yet been located. Ben. Holladay proposes to build this road, and already there are a number of engineers surveying a route. The whole distance from the Columbia river to Port Discovery is less than two degrees of latitude, and the country is eminently calculated for railroad purposes. The greatest maximum hight is but 200 feet, and the greatest maximum grade not over forty feet to the mile—no tunneling or deep cutting—and the timber that will have to be cleared to make a roadway will more than suffice to bridge over ravines or streams, or make tressle-work or piling to cross morasses.

SIX AND A QUARTER MILES.—The Whitworth nine-inch gun, by which the unprecedented range of 10,300 yards was obtained at Shoeburyness on the 20th ult., was fired again the following day, when it beat even its previous performance, and with 33 degrees 5 minutes elevation, and a 50-lb charge, threw a 350-lb shell to 11,127 yards, first graze, being about 1,000 yards farther than ever iron mass was hurled by any other gun.—*London Artizan, Dec.* 1.

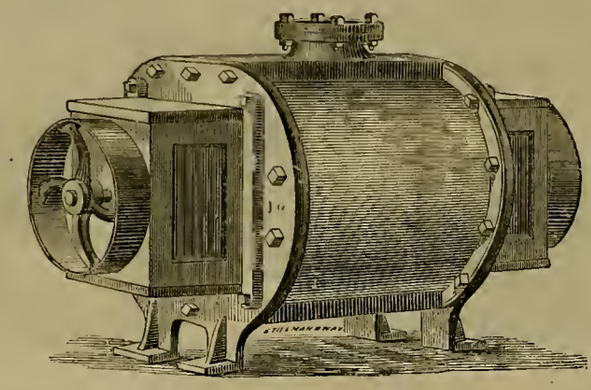
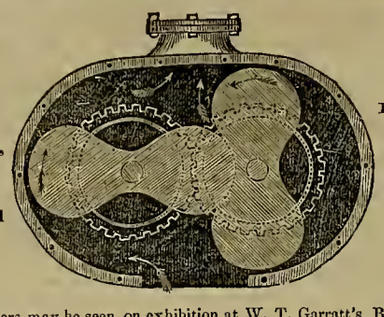
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.





ADAPTED FOR Smelting, Foundry, Mining and Steamships.
REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA!
Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

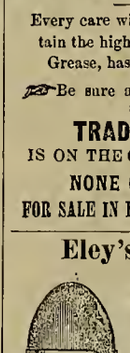
Eley's Ammunition.



These Cartridges are made in three sizes, viz .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .450 (or small) bore.
These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.
They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.
Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.
Makers of BOXER CARTRIDGES, .45 bore for Revolving Pistols, in use in Her Majesty's Navy.
PIN CARTRIDGES for Lefaucheux Revolvers of 12 m, 9 m, and 7 m, bore.
CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles, and Revolvers.
Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.
Wholesale only.

INTRODUCTION OF EASTERN AND EUROPEAN INVENTIONS.—This is a constant business, offering,—and in frequent cases substantially awarding, as most of us have had occasion to witness,—great prizes to the ingenious, who are at the same time thonghtful and well informed enough regarding the wants and the inevitable developments of the coast to exercise a correct judgment in the premises. Such an invention is the Douglas patent dry brick-making machine, which has just been brought here by Mr. S. L. Pereira, of 204 Montgomery street, and which we hope to see at work shortly, and to be able to describe more fully. A new railroad buffer spring as a substitute for rubber, to be seen at the same place, is an entirely novel method of taking advantage of the elasticity of iron, consisting in placing over each other a number of cone-shaped rings, in all admitting of a spring of about two inches. The Miller pavement (resembling the Perry); a patent oiler; and a variety of Bessemer steel rails, and house props and beams, products of the French iron smelting and manufacturing establishment of Petin, Gaudet & Co., of which Mr. P. is the agent, may also be seen. The Hamar patent timber curing process, for the preservation of wood from decay and from marine insects, is also being introduced, and is a simple ont-door process, whereby sulphate of copper or of iron is made to take the place of the sap. An elevation of the tub or barrel containing the solution, to twenty-five or thirty feet, gives pressure enough to inject the solution into the pores, while the sap is being forced out at the opposite end of the stick.

NEW VELOCIPEDES.—There has just been completed, at the Ætna Iron Works, a velocipede of novel construction. The wheels, of which there are three, consist of light hoops similar to the felloes an d tires of ordinary wheels, in the centers of which the axles are suspeuded by light eteel wires (No. 16) instead of wooden spokes. By this means great strength, lightness and elasticity are aimed at. The driving wheels are eight feet four inches in diameter, and upon the axle rest nearly the whole weight of the framing, and of the operators. The framing is of wood, braced with steel wires. The power is communicated by a peculiar treadle arrangement, upon which the operator stands erect, and not only exerts a force equal to his weight, but when he desires to do so he can add to this force another exactly equal to what he could lift under the most advantageous circumstances. The result of this arrangement in speed must be a maximum. The machine is completely under control, and can be instantly stopped, started, or reversed, by setting the guide wheel at the proper angle. The whole machine can be driven around in either direction in so small a circle that the radius of the track of the inner wheel will be less than twelve inches. The inventor and constructor is David R. Smith, Civil and Mechanical Engineer.

Those who visited the Pavilion at the Pavilion at the last Mechanics' Fair (and who did not?) will remember that the fleet of miniature ships that sailed so beautifully around the fountain was also an invention of Mr. Smith, suggested by observing that a current of air was produced by the falling water. The application of sails to the rotary boat at Woodward's Gardens, is on the same principle.

SOCIAL VOICES, the organ of the literary society of Dr. Stone's church, edited by Chas. J. King, has just entered upon its third volume. Like the pleasant literary reunions of which it is a representative, refined social life, and a great deal more of literary talent than one would expect to find under such modest pretensions, characterize the substance in hand, as well as the manner of treating it.

THE Hafenegger powder trial last Saturday was postponed on accouut of the extraordinarily bad weather.

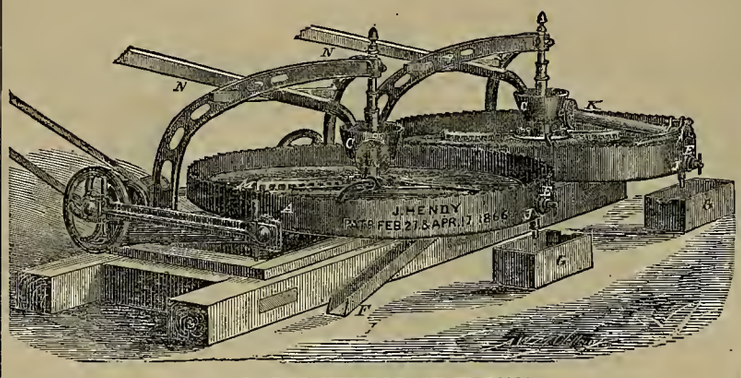
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Oldest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, **414 Clay Street,** San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its nies contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS

All progressive information, in fact, transpiring with THE TIMES—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its SEVENTEENTH VOLUME, and enjoys a large circulation It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, *That we regard a mining paper or journal of great importance to the mining interests of California and recommend the* MINING AND SCIENTIFIC PRESS, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money orders.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

New Incorporations.

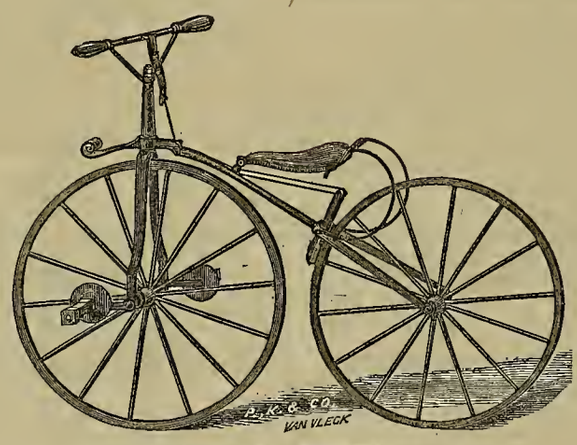
THE GEOGRAPHY OF EASTERN NEVADA, though still imperfectly laid down, is more fully given in Mr. Gibbes' map, (published by Warren Holt, No. 411 Kearny street, to whom we are indebted for a copy) than in any other publication, being on twice as large a scale (12 miles to the inch) as Bancroft's large map of the Pacific States, and representing the overland and other road stations, and the mountains with a degree of exactness that will enable a person who has traveled over the latter easily to identify the country. The mountains, with their intervening valleys, as far east as the boundary of Utah, and including all along the Pacific Railroad from the meridian of Winnemucca on, are pretty well represented in general aggregates that can be depended upon as at least approximately correct. So far as the U. S. Land Surveys have extended, the results of which are on record at the U. S. Surveyor General's office at Virginia City,—embracing a considerable amount of work done by Epler and others—and along the Ives' Pacific Railroad surveys, mapped and accessible at the office of Mr. Montague in Sacramento, the present map, as it probably embodies the same, may be taken as reliable; the rest of the topography having been jotted in from rude triangulations. or by eye measurements, which are in most cases not far out of the way.

WATER WHEELS.—We are told by one who ought to know, that our recent remarks, to the effect that the Jonval turbine wheel furnishes the highest percentage of absolute power, but was not as cheap in proportion to the power furnished as certain others,—are by implication somewhat unfair, in omitting to state that the improvements on the old Jonval wheel, such as the Bodine Jonval, represented on this coast by Fuller & Co., of No. 109 Montgomery street, have entirely altered those relations; a proposition that we are certainly willing to accede to.

PETRIFACTIONS abound at Rock Creek, on the Union Pacific Railroad, east of the hight of land. The report is that they are "snakes of all sizes, some straightened out, others coiled up; and shells of every possible kind—oysters, clam, mussel, conch, etc."

The Velocipede.

A visitor to the Mechanics' Institute Pavilion on Post street, will find its "magnificent distances," and its superb dancing floor, enlivened by the gambols of a score or so of velocipedists, on machines generally of the character represented in the cut. These appear to be the most popular, on account of the airy appearance of ghostly nothingness, which seems to be all that there is to support the rider, as he passes along at a speed which admits of little more than the circumference of his wheels, and the rider himself, with his horizontal coat tails, from being individualized. It is by means of the curved springs supporting the saddle, that this appearance of lightness is obtained in the "California velocipede," as it is called by the manufacturers, Messrs. Palmer, Knox & Co., of the Golden State Foundry, who have introduced several useful improvements on the French machine. A large number of velocipedes of superior quality and lightness have already been manufactured, and orders are being filled from many points in the interior. At Caseholt's, and at Kimball's carriage factories, velocipedes have also been manufactured; and machines of peculiar pattern are being made at the Fulton Foundry and at other places, privately.



THE CALIFORNIA VELOCIPEDE.

So simple is the machine, in all its parts, that no description is required to help out the accompanying illustration, except in regard to the brake, which regulates the speed in running down hill. This is seen underneath the saddle; from its upper end a cord connects with the steering handles, the revolving of which draws the cord, and presses the lower part of the brake upon the hind wheel.

But the manner of operating the velocipede is not so easily described, nor very easily acquired. "*Figaro*" does justice to it in the following:

The first feeling on bestriding the bicycle, and resting one's weight upon the saddle, is that of utter inability to maintain the necessary equilibrium. The tendency to topple over appears to be insurmountable by any skill which the learner can hope to attain. It is difficult for him to see how any vehicles having but two wheels, one directly in advance of the other, can be made to stand or run upright, unless held so by some extraneous means. A little reflection, however, will remind him that any kind of a disk—as a wheel or ring—if propelled along the ground, will maintain its erect position so long as it keeps in motion; and that the same principle of centrifugal force which bears up the disk and keeps the spinning-top erect, maintains the equilibrium of the velocipede while in motion. The handle of the machine is to be grasped firmly in the hands of the rider, and when skillfully manipulated it acts in a certain sense as a balance pole; the handle guides the fore wheel in any direction, while a quick turn toward the side to which the learner feels himself falling, will restore the balance, until at length it can be maintained with but little effort.

A sedate editor of one of the morning dailies reports his experiences at the Pavilion as follows:

We were finally persuaded to visit the ante-room, or stable, where a dozen or more velocipedes stood chained up; and, while viewing them, the argument of the necessity of our learning to ride was again forced upon us. A safe ride of a few yards, with toes touching the ground, together with the passing of a crowd of laughing velocipedestrians, inspired us with confidence that all that was required was to place the feet on the cranks on either side of the hub of the front wheel, and join the merry throng moving around the hall with such ease and grace. No sooner contemplated than accomplished. The floor of the hall in the direction we were going, was of a down grade, and soon we were gliding along at a rapid rate. We looked forward to see if there was any obstacle to be passed. That look fixed us. The treacherous front wheel of the machine turned a quarter round, and, not being constructed to go in that manner, the velocipede stopped and laid down. We continued on for a short distance, until at last the friction of our nose upon the floor brought us to a dead halt. Our new leaver continued on several yards further, when, after turning several short corners it too came to a halt. We arose seriously, and, after rubbing our shins and feeling the amount of damage caused by using our nose as a brake, we calmly viewed the situation. Things wore the aspect of a smash up. A coarse laugh from a crowd of spectators who had gathered around our friends, grated harshly upon our ears.

The velocipede can only be used to advantage under the favorable conditions of smooth and level roads. The American *Artisan* says:

The speed attained by the swifter kind of French velocipedes averages from twelve to thirteen miles an hour; adepts find no difficulty whatever in accomplishing fully fifty miles within five hours without once alighting from their vehicles. A couple of amateurs making a tour through a part of France, challenged each other as to which could perform the greatest distance within four-and-twenty hours. One gave in after having accomplished eighty-seven miles; the other went on an additional thirty-six miles, making 123 miles in all. On the 21st of September last, a party of nine quitted Rouen early in the morning, mounted on velocipedes, and arrived in Paris in time for dinner the same evening, having performed the distance of eighty-five miles, exclusive of stoppages, at a rate of speed averaging ten an eleven miles an hour. It should be understood that, in impelling a velocipede, the limbs are not constantly in motion; as on level ground, when the impetus is at an average rate, or when the machine is descending an incline, the feet may be removed from the pedals, and the legs be placed on the bar fixed in front of the velocipede for this purpose. A slight impulsion given to the vehicle, from time to time, suffices to keep up the speed. The ascent of an incline greater than one foot in twenty-five, is considered difficult, if not impracticable. When the rider, therefore, encounters a hill of more than the average steepness, he has to dismount and lead his velocipede with his hand, which, we are told, he can do with almost the same ease as he can carry an ordinary walking-stick.

We are informed that Messrs. Palmer, Knox & Co. have found it necessary repeatedly to increase their working force in the velocipede department, in order to meet the demands made upon them for the article.

COAL BEDS AT SAN DIEGO.—Interest is being revived in the old Mormon coal shaft at Point Loma, in San Diego harbor, the *Union* of Jan. 23d asserting that extensive beds of good anthracite coal are found underneath the harbor. In 1856, the San Diego Coal Company bored down through strata as follows: Blue slate, nineteen feet; freestone, two feet; slate, one foot; coal, six inches; slate, three feet six inches; coal, six inches; slate, sixteen feet; grey rock, eighteen inches; slate, two feet; and so on to a depth of less than one hundred feet, when a stratum of coal was struck four feet six inches in thickness. This is probably not genuine anthracite, but tertiary brown coal, such as is found everywhere along the coast in small seams.

TAXATION OF MINES IN NEVADA.—A bill has been introduced by Senator Mulleu in the Nevada Legislature, providing for taxation of the net proceeds of the mines, in lieu of the present method by which the value is assessed after making a deduction of so many dollars per ton as cost of extraction and reduction. The present statute has been regarded by the owners of mines in Eastern Nevada as unjust, and as imposing a disproportionate burden upon them; while the Comstock lode people are opposed to the change, as it is likely to increase the assessment upon the ores taken from that lode.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Manufacturing at Santa Cruz.

THE PAPER MILL.

Eds. Press:—I find the Santa Cruz paper mill going, and apparently doing a fine business. It is located at San Lorenzo, three miles from Santa Cruz. Through the kindness of the foreman, Mr. P. Morsey, I got an insight into the method of making brown wrapping paper. I am told that there is more money in that than there will be in making finer qualities of paper for some time to come. First, you see a large shed containing straw, which is taken into the works on a truck, and put into two large vats eighteen feet in diameter and nine feet deep. They put in lime also, and steam it for twenty-four hours; then the straw is taken out and put into other vats, where it undergoes further processes of being worked into pulp for the rollers.

They have seven hands employed, and turn out 100 reams of brown paper in 24 hours, working only in the day time at present, but they intend to run night and day shortly. The machinery is run by turbine water power; but they have a large boiler there for making steam. John Sime, the banker in San Francisco, is the owner.

FUSE FACTORY.

I am indebted to Mr. Richard Uren, one of the proprietors of the fuse factory at Santa Cruz for the following facts: Mr. Uren came to this State from Michigan, having had some experience there in the same business. The experiment proving successful, he has gone to an expense of $30,000 in putting up new works, to be run also by water power, on Zayante creek, seven miles from Santa Cruz; which are nearly finished, and will be in operation in the spring. These will employ seven men and turn out fifty million feet of fuse per year. Mr. Uren has worked at mining, and therefore understands perfectly what kind of an article is required. All his machinery comes from the States, the half of it having already arrived. I understand that the mines at Grass Valley and Virginia City were formerly chiefly supplied with fuse by Mr. Uren, which brought him to the conclusion it would pay well to manufacture the article in this country; and his success justifies the action he has taken. This is a splendid place for mills and for work of this kind. There is plenty of water and wood, and I understand that the land is very cheap.

THE CALIFORNIA POWDER WORKS

are located about four miles up the creek, and are very large. The first place I got into was the refining room for the nitre or saltpeter, where they have four large vats, two for dissolving, and two for crystallizing, besides two tubs for washing. The second room is for drying and grinding. The third is the charcoal house, on each side of which there is a long furnace; the same being connected with ten retorts on the one side, and eight on the other, which are all three feet in diameter and four feet long. The fire passes around the outside of these retorts, which contain the wood that is to be charred, and so brought into a suitable condition to serve as one of the ingredients of powder. They burn four cords of wood in them per day; when properly burned they take it out and put it into coolers, of which there are thirty-six; allowing it to remain there for twenty-four hours. The fourth room is for pulverizing, and contains two large pulverizers. The fifth room is for mixing the charcoal and sulphur.

There is another room, where five pairs of big wheels are engaged in grinding up the powder after it has been mixed with saltpetre. It is here where the danger of explosion exists, unless the work is very carefully watched by the men. Six and a half kegs are ground at a time, and for about two and a half hours. There is, besides all these, a pressing room, where fifty large cakes, equal to forty kegs of powder, are pressed at once. These are then taken to another room and broken up into pieces and dried at a temperature of 130 degrees.

All these rooms are from 30 to 175 feet apart, so that if one should explode or burn up, the others would not be damaged.

They are turning out sporting, rifle, cannon, blasting, and fuse powder. Twenty-five men are employed in making powder, and twenty-five more in making kegs, and filling them. With this force they turn out with the aid of machinery for the purpose, 400 redwood kegs per day. Much care must be taken in making the kegs, as they have to be very tight and well made, for safety from fire as well as for protection from water. The number of kegs filled with powder that are turned out daily, is 390.

A tunnel 1,160 feet in length has been cut through the mountain between the works and the river, from which they have thus secured a fall of thirty-five to fifty feet.

On entering the works, the visitor is required to take a brush and wet his boots in order to get off all the sand and dirt that may adhere to them. A place is planked all around the yard to walk on. It is only recently that operations have been resumed here, after a repairing spell of about six weeks.

W. H. M.

Santa Cruz, Jan. 26, 1869.

Idaho Developments.

MINING ITEMS.

Editors Press:—The news from the mining districts is good for this season of the year. Owyhee is proving the wealth of her renowned lodes. At Yuba, Mr. Defrees cleaned up, after running 130 tons of ore from his Leonora lode, and is reported by men working in the mill, to have cleaned up about $9,000. He has only a battery, and neither pans, concentrators, nor separators; and the mill is small and inferior at that.

SNOW AND CLIMATE.

Yuba has not so snowy a climate, apparently, as Rocky Bar, the county seat of Alturas County, from which it is distant about eighteen miles. At the "Bar" there is four feet, on the South Boise River, three feet, and on Camas Prairie, about two feet of snow at present. After leaving the hills there is not any snow worth noticing; perhaps from one-half to one inch, and spotted,—a few spots being frozen into ice. The days have been thus far clear, and almost cloudless, but at night the thermometer goes down to + 16 or + 12 of Fahrenheit.

THE WHITE PINE FEVER

is prevalent, but the epidemic is much held in check by the cold weather, as the very thought of several days' traveling by stage in such weather has a wholsome effect; and most say, "wait awhile."

But why so many thousands should rush from here to White Pine is not plain. This is a fine, rich gold and silver territory, several hundred or thousand feet less in altitude, with a correspondingly milder climate, and hundreds of lodes in a greater or less state of development, rich enough for any reasonable man.

BOISE VALLEY WATER COMPANY.

On the 22d of October last, the certificate of incorporation of the Boise Valley Water Company was filed; capital, $10,000. The survey was soon after carried out, contracts were let, and now the canal to this city is about one-third finished; all the heaviest work is completed, and the whole canal is to be finished by the 1st of March. The canal is five feet wide at the bottom, seven at the top, and two feet deep, with grades of one-eighth inch to the rod. The present contract is only to this city, but the company will, in all probability, carry it along the foot of the hills for several miles down the valley, though to do so will necessitate an increase of their capital stock. This irrigation canal, if carried out, would bring into cultivation many hundreds of acres of now profitless land.

FARM STOCK.

A great want in this country is good horses at fair rates; for our farmers, as a general rule, seem to think scrub stock as good as any. There is not a single fine-blooded stallion in the country.

The same remarks will also apply to horned stock. A cow that will make seven pounds of butter a week, is thought a good cow.

Sheep are scarce, and mutton retails at twenty-five cents per pound in the markets.

It is true our farmers, mostly men who came here in 1863-4, from the States, many having "lost their all" in the war, and have struggled against high prices of "store goods," crickets, grasshoppers, a want of knowledge of climate, and in some instances we fear from the "canna'-he-fashed" style of some of the North Britain folks. Some sell the wood off their farms for fuel wood, and thus in winter eke out a precarious living, and now that prices are all down, they are discouraged.

Yours, respectfully, Pegasus.

Boise City, Jan. 20th, 1869.

Mining Laws of White Pine Mining District.

Tuesday, Oct. 10th, 1865.

A company of miners met on the above day for the purpose of forming a district. The meeting was called to order and Robert Morrell was nominated to act as President.

Motion made and carried, that this district be known as White Pine District—bounded on the north by the Red Hills, and running from thence south, to a point where the mountains run into a foot-hill; from thence east, twelve miles *from thence;* from thence north, and from thence west to the place of beginning; the district being twelve miles square.

Thomas J. Murphy was nominated to act as Recorder for the District, and was duly elected Recorder of White Pine District for a term of twenty-four months from date.

On motion, the following by-laws were presented and approved:

Sec. 1. The Recorder shall go on the ground and record all claims, for which he will be allowed one dollar per name, after which, no mine can be re-located; but belongs forever to the parties whose names are recorded.—[*Amended.*]

Sec. 2. There shall be an election for a new Recorder on the 10th of October of every second year, who shall be in office as Recorder for two years, unless by death, removed, or by other reasons, when a notice signed by fifty miners of the district, can call a meeting, published by a notice posted thirty days in the district, and advertised for thirty consecutive days in the Reese River papers.—[*Amended.*]

Sec. 3. It shall be the duty of the Recorder to keep in a suitable set of books, or book, a full and truthful record of the proceedings of all public meetings; to place on record all claims put on notice or brought to him for record, when such claims shall not interfere or affect the rights or interests of prior locators, recording the same in order of their date. It shall be the duty of the Recorder to keep his books open, at all times, to the inspection of the public. He shall also have the power to appoint a deputy to act in his stead. It shall be the duty of the Recorder to deliver to his successors in office all books, records, papers, etc., belonging to or pertaining to his office.

Sec. 4. All examinations of the records must be made in the full presence of the Recorder or his deputy.

Sec. 5. Notice of a claim or location of mining ground by any individual, or by a company, on file in the Recorder's Office, shall be deemed equivalent to a record of the same.

Sec. 6. Each claimant shall be entitled to hold by location 200 feet on any lead in the district, with all the dips, spurs, angles, offshoots, outcrops, depths, with variations, and all the mineral and other valuables therein contained. The discoverer of, or locator of a new lead being entitled to one claim extra for discovery.

Sec. 7. The locator of any lead, lode or ledge in the district, shall be entitled to hold on each side of his lead, lode or ledge, located by him, or them, one hundred feet. But this shall not be construed to mean any distinct or parallel ledge within the two hundred feet, other than the one originally located.

Sec. 8. All locations shall be made by a written notice posted upon the ground.

Sec. 9. Every claim located by individuals or company, shall be recorded within fourteen days after the date of location. [*Amended.*]

Sec. 10. The Recorder shall be allowed fifty cents per name for every name on an abstract of record furnished by him.

Sec. 11. The Recorder or his deputy is not required to reside constantly in the district.—[*Amended.*]

Sec. 12. These laws cannot be amended, altered or repealed, for two years.

Sec. 13. Those laws shall take effect on and after the 10th day of October, 1865.

Recorder's Office, Mohawk Canon, White Pine Mining District, July 20th, 1867.

Pursuant to a call, issued by the Recorder, the miners of White Pine Mining District met at the Recorder's Office, Mohawk Cañon, on Saturday, July 20th, 1867, for the purpose of electing a Recorder and amending the by-laws of said district.

On motion made and seconded, H. Woodson was chosen Chairman, and A. J. Leathers, Deputy Recorder, acted as Secretary.

The following amendments to the by-laws were submitted and adopted:

Sec. 1. The Recorder shall be allowed fifty cents per name for recording, instead of one dollar.

Sec. 2. When a claim is located and the proper notice put on it, there shall be allowed ten days to file a notice for record, and thirty days additional time within which the proper amount of work must be done on the ledge.

Sec. 3. All locations already recorded, shall have two days' work done on them for every location on or before the 1st day of February of each year, which work shall hold good until the 20th of July of the same year, and all locations made hereafter shall have the same amount of work done on them within forty days after locating them, which work shall hold good for one year from the date of the record of such work.

Sec. 4. Any location having the necessary amount of work done on it as in the previous article, shall have the same surveyed and the work recorded by the Recorder, within ten days after said work is done, and the Recorder shall receive two dollars for his services to survey and record the same.

Sec. 5. Any claim upon which the necessary work is not done by the 1st of February shall be subject by re-location.

Sec. 6. Any claim having the necessary work done upon it within three months previous of the adoption of these by-laws, shall be considered as having done work to hold for one year from this date, the same being duly recorded as per section fourth.

Sec. 7. The Recorder shall have the privilege of absenting himself from the district, but shall have a deputy appointed to attend to his business during such absence, and in case of resignation, removal or death of the Recorder, the deputy shall immediately give ten days notice by placing written notices at three conspicuous places in the district that an election will be held for Recorder, stating time and place, when a majority of the miners present shall elect to fill the vacancy for the unexpired term, and until such officer be qualified, the deputy shall act as Recorder.

Sec. 8. The Recorder shall, upon the written application of five miners, call a special meeting of the miners of the district, when it shall require a majority of the miners of the district to transact any business; but at the annual meeting on July 20th of each year, a majority of the miners present shall have power to transact any business coming before the meeting.

Sec. 9. Work done upon any portion of a location shall be deemed as having been done for the benefit of the whole of said location, except in case as stated hereinafter.

Sec. 10. No person shall have the privilege of participating in any meeting except *bona fide* miners of the district; and no person shall be considered a miner unless he has a claim recorded and worked according to the by-laws.

Sec. 11. In case where a portion of a company refuse to do the necessary amount of work to hold their claim, after being notified by placing a written notice on the Recorder's office for twenty days, and the other portion of the company wish to work enough to hold their part of said claim, they shall give notice in writing of their intention to the Recorder, and designate what part of the claim they wish to hold, and have the work recorded for that part of the claim, and the balance of said claim shall be subject to re-location if the laws are not complied with.

Sec. 12. The Recorder's term of office shall be one year, or until his successor is qualified.

Sec. 13. All previous by-laws, or parts of by-laws, conflicting with these by-laws, are hereby repealed.

Gold Discovered in England.—A sensation has been created throughout the eastern district of Sutherland within the last few weeks, by a report that gold had been found in Kidonan Strath. Whether it is in paying quantities is another question.

Mechanical.

THE TELEPHONE.—At a recent meeting of the Polytechnic Branch of the American Institute, Dr. Vanderweyde exhibited a new apparatus called the Telephone,—intended to transmit a musical melody by telegraph. It consists of two wooden boxes, one to send the tune over the wire and another to receive it. The first has on its upper surface a round hole with a stretched membrane; so that when by a mouthpiece a person singing throws his voice into the box, this membrane will follow the vibrations of the air corresponding with the tones. In the center of this membrane, a small disk of platinum is attached, which is placed in connection with one pole of a galvanic battery. Over this disk is placed a point of the same metal, which is connected with one of the telegraph wires, and by means of a set screw may be placed at a very small distance from the disk; so that when the membrane vibrates, a rapid succession of contacts is produced. It is clear that when, for instance, the tone is attended with 128 vibrations in a second, the electric current sent over the wire is interrupted 128 times every second. The box at the other end of the line, is a sounding-board, with an electro-magnet; the coil of this being attached with one end to the main wire, and with the other to the earth current, it will become magnetized and unmagnetized one hundred and twenty-eight times in a second, and put the electro-magnet in corresponding vibration; producing a sound, it is true, very soft, and of a nasal character, but very distinct at a short distance,—so that the different tunes are easily recognized at the other end of the line.

TO FIND THE LENGTH OF THE CIRCUMFERENCE OF ANY CIRCLE.—Cyrus P. Grosvenor sends the following to the *Scientific American:* Multiply the difference of the diameter and diagonal of a square of any dimensions by ten, and from the product substract the diameter; the remainder is the length of the circumference of the largest circle which can be inscribed within the square.

How to construct a useful measure.—The rule being very brief is easily remembered and applied.

On a planed board draw a square six inches in diameter and through its center a diagonal line from corner to corner. Extend one side of the square in a straight line indefinitely, or about twenty inches. With dividers or compasses take the diameter and set it on the diagonal at one end, marking the distance. Now take the remainder of the diagonal line with the dividers, and walk them on the extended straight line, including the diameter of the square, ten steps. The distance outside the square is the length of the circumference of a circle of the diameter of six inches.

To apply this measure to circumferences of greater diameter, multiply it by the number of times six inches are contained in such diameter; if the given diameter is less, divide the measure accordingly.

STRENGTH OF METALS.—A bar of cast lead, one inch square, breaks under a strain of 860 pounds; a bar of cast silver will not break until the strain reaches 45,500 pounds; a bar of cast iron will remain intact until the strain exceeds 59,000 pounds; the best wrought iron will bear a weight of 84,000 pounds to a bar an inch square; and a similar bar of steel has been made of such tenacity as to lift a weight of 150,000 pounds before breaking. An alloy of two metals nearly always possesses greater tenacity than either one does separately. A strip of sound oak wood an inch square has been found to lift and sustain 17,300 pounds before breaking; and a similar strip of locust, 20,000 pounds.

STEELING RAILS, POINTS AND CROSSINGS. Mr. Edward Gray, of Sheffield, has patented "a Peculiar and Economical Mode or Method of Strengthening or Rendering more Durable the Rails, Points and Crossings of Railways," which consists in applying to or combining with the iron before it is completely shaped an outer skin or covering of steel, either by welding it on to the iron by the aid of a forge hammer or rolls, or by casting it on the iron by placing the heated iron in a suitable mold and pouring the melted steel over those parts to which it is to be applied.

NEW FRENCH BORING APPARATUS.—*La Houille* describes M. Villepigue's invention as follows: The borer is held by a screwed shaft, which moves in a collar, capable of turning with it, or remaining fixed against a brake. By this means the progress of the boring tool can be made dependent upon the hardness of the rock, the force applied by the workman to the handle being at all times equal. The weight of the apparatus is only forty pounds, and it can be very easily worked. It is supported by a column, which is capable of being fixed in any position, so as to bring the borer opposite its work. All kinds of rock attackable by steel can be operated upon by this machine, and as the boring tool has a spiral form the pulverized rock is thrown out of the hole as fast as produced. The machine will bore from five to six inches per minute in ordinarily hard limestone.

SET ON FIRE BY STEAM.—"We have on our table specimens of boiler lagging, of pine wood, inclosing the steam space and defended by a sheet iron jacket, that are reduced to the condition of porous charcoal, lighting readily by a spark. Cases have been recorded where dry wood was ignited by escaping steam at a distance of not less than thirty yards from the boiler; and we know, personally, where as an experiment, we lighted oil-saturated cotton waste and dry pine wood by the steam from a boiler at a distance of twelve feet,—the boiler pressure being at the time only 95 pounds temperature,—by Regnault, 335°. The materials burst into flame in a few minutes."—*Scientific American.*

CONDENSATION IN CYLINDERS.—The greater part of the water which collects in unprotected cylinders, and which was once supposed to be wholly carried over in the liquid state from the boiler, is produced by liquefaction of part of the steam during its expansion. This liquefaction does not, when it first takes place, directly constitute a waste of heat or energy; for it is accompanied by a corresponding performance of work. It does, however, afterwards, by an indirect process, diminish the efficiency of the engine; for the water acts as a distributor of heat and equalizer of temperature, abstracting heat from the hot and dense steam during its admission into the cylinder, and thus lowering its pressure. *Artisan.*

HARD CEMENT.—M. Schwartz is the originator of this recipe: "To four or five parts of clay, thoroughly dried and pulverized, add two parts of fine iron filings free from oxide, one part of peroxide of manganese, one-half of sea salt, and one-half of borax. Mingle thoroughly and render as fine as possible, then reduce to a thick paste with the necessary quantity of water, mixing thoroughly well. It must be used immediately. After application it should be exposed to warmth, gradually increasing almost to white heat. This cement is very hard, and presents complete resistance alike to red heat and boiling water."

TO COLOR ZINC AND BRASS.—Zinc may be given a fine black color, according to Knafll, by cleaning its surface with sand and sulphuric acid, and immersing it for an instant in a solution composed of four parts of sulphate of nickel and ammonia in forty of water, acidulated with one part of sulphuric acid, and washing and drying it. The black coating adheres firmly, and takes a bronze color under a burnisher. Brass may be stained black with a liquid containing two parts arsenious acid, four hydro-chloric acid, and one of sulphuric acid, in eighty parts of water.

PROPER POSITION FOR AN INDICATOR.—Messrs. Randolph, Elder & Co. have proved that when a rapid current of steam blows *across* the orifice of the nozzle of an indicator, the indicated pressure is less than the real pressure. Every indicator, therefore, should be fixed, if possible, in a position where it is not exposed to this cause of error.

THE ECONOMY OF SUPER-HEATING.—According to recent experiments on a large scale, upon marine engines fitted with super-heating apparatus, about 20 per cent. of fuel was saved by super-heating steam at a pressure of twenty pounds per square inch above the atmosphere, to the extent of 100 degrees Fahrenheit.

LIQUID METALLIC ALLOY.—The only alloy which is liquid at the ordinary temperature, is one consisting of equal parts of potassium and sodium. Both of these metals are solid at the same temperature until brought together.—*Piesse.*

Scientific Miscellany.

DETERMINATION OF CARBON IN GRAPHITE. Professor G. Hinrichs of Iowa City, sends the two following methods,—devised by Dr Gintl, of the University of Prague,—to the *American Journal of Mining:*

First Method. The finely-pulverized graphite is dried at about 150° to 180° C. and weighed in a tube of glass (1 centimeter wide, and about 10 centimeters long), closed at one end, where it forms a small bulb. Of pure lead oxide, well ignited, a weight of about twenty times the weight of graphite taken, is added, and well mixed with the graphite by means of a wire; then the tube with this mixture is weighed.

In a good blow-pipe flame, or in the flame of a blast-lamp, the tube is heated and continually turned, until its contents are completely fused, and no foaming takes place. The tube is now cooled and weighed again; the *loss* in weight represents the amount of escaping carbonic acid, formed from the carbon in the graphite, and the oxygen in the lead oxide. The amount of carbon accordingly is,—since $CO = 12 + 32 = 44$,—twelve forty-fourths, or three-elevenths of this loss of weight.

Second Method. The finely-pulverized graphite is intimately mixed with an excess of nitro, and the mixture heated in a porcelain crucible, until no graphite remains visible. Thereby the carbon is also oxidized to carbonic acid, but remains in the fused mass as carbonate of potassa. The carbonic acid contained in this fused mass is now determined in the usual way, by expelling the carbonic acid with nitric acid in any of the common apparatus.

ZIRCONIA.—We give, from the *Chemical News*, a part of the specification of Du Motay and others, who have patented in England an invention for improvements in preparing Zirconia for use. The peculiar properties of this substance, and the manner of separating it from its ores, are therein given:

"Zirconia, or oxide of zirconium, in whatever manner it may be extracted from its ores, can be agglomerated by compression; for example, into sticks, disks, cylinders, or other forms suitable for being exposed to the flame of mixtures of oxygen and hydrogen,—without undergoing fusion or other alteration. Of all the known terrous oxides, it is the only one which remains entirely unaltered when submitted to the action of a blow-pipe fed by oxygen and hydrogen, or mixtures of oxygen with gaseous or liquid carbonated hydrogen. Zirconia is also, of all the terrous oxides, that which, when introduced into an oxy-hydrogen flame, develops the most intense and the most fixed light.

"To obtain zirconia in a commercial state I extract it from its native ores by transforming, by the action of chlorine in the presence of coal or charcoal, the silicate of zirconium into double chloride of zirconium and of silicium. The chloride of silicium, which is more volatile than the chloride of zirconium, is separated from the latter by the action of heat; the chloride of zirconium remaining is afterwards converted to the state of oxide by any of the methods now used in chemistry. The zirconia thus obtained is first calcined, then moistened, and submitted in molds to the action of a press with or without the intervention of agglutinant substances, such as borax, boracic acid, or clay."

THE HIGHEST MOUNTAIN IN EUROPE.—Elburz, the highest peak of the Caucasus, was ascended during the last summer by a party of Englishmen, and its hight found to be 18,526 feet. As the boundary line between Europe and Asia is now recognized by geographers as the axis of the Caucasus range, and Elburz is on the European side of that line, it is therefore the highest mountain in Europe. Mont Blanc is some three thousand feet less in hight.

IMPROVED CARBON BATTERIES.—Gaiffe states to the French Academy that he finds the plan of Leclanche, of a voltaic battery, in which pounded coke is placed around the carbon, gives good results; and recommends it in all carbon batteries, as considerably augmenting the surface of the carbon element and bringing it nearer to the surface of the porous cell, thus diminishing the internal resistance. In the case of sulphate of mercury and sulphate of lead batteries, he found that *constancy* was almost attained, the needle receding only one degree in 24 hours, from 28° to 27°.

PREPARATION OF PURE WATER.—J. S. Stas gives a new method of preparing perfectly pure water, for delicate analytical operations. It is founded on the use of manganato and permanganate of potassa for the destruction of the minute portions of organic matter. The solution is prepared in the cold by covering with just sufficient water, the freshly powdered mixture resulting from the fusion of chlorate and caustic potassa with manganese; when clear, 4 to 5 per cent. of the volume of the water intended for purification is added to that quantity, and the mixture left standing for twenty-four hours. The still is then charged with another portion of permanganate solution and an equal bulk of *liq. potassæ*, and lastly filled to four-fifths with the water previously mixed, after which distillation is made to proceed as usual.

As soon as the contents reach the boiling point, the heat is moderated to prevent boiling over, to which they are liable from the violent intumescence which occurs. When this ceases the liquid is kept at a constant boil. The first 5 per cent. coming over is rejected, and the remaining, if proper care be had to arrest any drops accidentally carried over, is collected as pure; though, if wanted absolutely pure from any solid or condensable matter, the water after this is once more rectified from a still,—a platinum tube, soldered with gold, serving as condenser.—*Druggists' Circular.*

GOLD IN PYRITES.—"As regards the argument advanced by the adherents of the sulphide theory, that the gold only becomes visible after a preliminary roasting, it finds its explanation in the disintegration which the pyritic particles that surround the gold suffer by the heat. Metallic gold is sometimes visible in undecomposed pyrites, with and without the assistance of a magnifying glass. In disintegrated pyrites it often appears in the forms of scales and grains, which could not be the case if it was contained there in a chemically combined state. Fourcroy's "General System of Chemical Knowledge," published in 1804, has the following passage:

"Bergmann observes that the gold which is extracted from auriferous pyrites by digestion in nitric acid, is in small angular grains,—which proves that this metal existed in the state of simple mixture and not of composition in the pyrites. Thus the ores of copper, silver, lead, iron, cobalt, antimony, from which gold is frequently extracted, by docimastic and metallurgical operation, appear to contain this metal simply disseminated amongst their particles; and there is reason to believe that when these ores are decomposed, the gold which separates from them is carried away by the waters and deposited in the sand as if it were native gold."—*Dr. Ott in American Journal of Mining.*

THE PRIMORDIAL CELL.—"The microscope has demonstrated that all forms of organic life, however complicated, originate in the same simple form,—the primordial cell,—and are built up only by the multiplication and aggregation of cells essentially similar, however apparently differing. It has demonstrated also that every complex organism, however it may possess an aggregate individuality, has nevertheless a multiple and complex life, each cell in the aggregate mass being gifted with an independent and distinct life of its own. It has revealed the existence of vast groups of organisms, vegetable and animal, which never attain a higher level than that of the single cell, yet which have in time past existed in such prodigious numbers that their fossil remains form the substance of great geological deposits, hundreds of feet in depth, and thousands of square miles in horizontal extent."—*President Barnard.*

ALCOHOL RECTIFIED BY GELATIN.—The following is from the *Chemical News:* The greediness of gelatin for moisture suggests a possible use for rectifying small quantities of alcohol, or removing water from collodion in which the use of imperfectly rectified solvents has caused a tendency to give crapy films. Put a little pure gelatin in the spirit to be rectified. There is no danger of any portion of it dissolving, but it will absorb the water and gradually swell; it may then be removed, carrying the water with it. This will be found more convenient than the plan sometimes recommended of agitating with carbonate of potash, and after subsidence decanting.

TRAVELS IN BRAZIL.—Captain Burton, (the discoverer of Lake Tanganyika) has a new book of travels in the press, under the title of "Explorations of the Highlands of Brazil."

California Academy of Sciences.

The Academy met on Monday evening, February 1st, Col. Ransom in the chair. Eighteen gentlemen were elected members, and donations were received of petrified wood from a mine near Grass Valley, presented by Mr. T. A. Mudge, (who at the last annual meeting was unanimously elected Secretary) and of a suit of armor worn by the natives of Alaska before the immigration of the Russians.

SILVER MINES IN SOUTHEAST CALIFORNIA.

Mr. H. G. Hanks read an interesting paper on the mineral resources of Owen's River and adjacent districts, and exhibited some marvelously rich specimens, forming a collection of two or three hundred. Mr. Hanks had explored the Montgomery, Blind Springs, Keyes, Inyo, Russ, Kearsage, Coso, Alabama, Telescope, Slate Range, Argus, Salt Spring, Washington, and other districts; also an extent of almost unknown country in Southern Nevada and Northern Arizona, whence many valuable specimens were obtained. Some of these were labelled as assaying equal to the White Pine ores.

The report referred more especially to the Inyo district, Death Valley, and particularly to the Gun Sight lead, the first silver lode found in California, of which any record exists. He stated that an immigrant party in 1849 came in and reported having seen fabulously rich silver mines on their way, and brought in specimens of pure silver. In 1850, Dr. French, at the head of a party went out to hunt for it, but unsuccessfully, and it has existed in story ever since. The finest specimens exhibited by Mr. Hanks were of argentiferous galena, tetra hedride, kerargyrite, stromeyerite, and molyhdate of lead. There was also a large and rich specimen of Partzite. Some from the Montgomery district, at the northern end of Owen's River, are fahl ores, and antimonial and chloride of silver, and show an abundance of the free metal.

Dr. Gibbons made an interesting statement in relation to the swelling and shrinking of adobe land under the influence of rain and drouth, its effect upon buildings, and observed that cracks in walls thus caused were often erroneously attributed to earthquakes.

New Inventions.

TO PREVENT INCRUSTATION OF STEAM BOILERS.—We learn that a Mr. Hugh McQuade, of Grant County, Oregon, has patented an invention for the prevention of incrustation of steam boilers. His method is to prepare the inside of the boiler plates before or after construction, with a galvanic coating of copper or some other substance with which silver will amalgamate. This always presents a smooth surface to which nothing will attach. His patent bears date Oct. 6th, 1868, and it is his intention to soon bring the invention to the notice of practical engineers on this coast. He has already had applications for the use of his invention, from parties at the East. It is stated that there have been over 300 inventions patented, having a similar purpose, none of which have been entirely successful.—*Portland Oregonian.*

WEBB'S ADDER.—This is not a snake, but a little machine intended at once, and without error, to furnish the sum of any number of figures that may be required. It consists of a flat piece of board to which are fastened two wheels of brass or silver, with an indicator; one of the wheels is marked with numbers from zero to ninety-nine; and on turning this wheel half around from the numbers to be added together, taking them one after the other, the indicator instantly shows what is the sum.

A PATENT has been taken out for a new process in cigar making. The leaf tobacco is ground to a pulp and run off in sheets, as paper is made, done up and sold by the quire or ream—and then every one makes his own cigar, if he pleases.

A PHILADELPHIA professor has invented a steam brick kiln, wherein 100,000 bricks can be evenly burned in three days.

A NEW car wheel has recently been invented, which is made in two parts, and consists of a web which is bolted fast to the hub, and a ring of rubber interposing between the web and the hub, which is secured by the belts and flanges to receive the jar of the loaded car. It is claimed that by this arrangement the cars ride more easily, and the danger of breaking the axle is diminished.

PROF. W. P. BLAKE has been appointed U. S. Assay Commissioner for California.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING JANUARY 19th.

85,892.—IMPROVEMENT IN WATE WHEELS. Edwin Adams, Orolewa, Cal.:

I claim the above described water wheel, having sliding buckets G G, working in a trough or channel C, said buckets being forced out at the proper point by the pressure of the water admitted through pipes O O, to central chambers K K, and operating in hollow arms F F, and being forced in, to pass the head of the trough, by cams P P, acting against the rollers I I, attached to the shoulders H H, the several parts being constructed and arranged, and operating together substantially as described.

The nature of this invention is to provide an improved water wheel with sliding buckets, for the purpose of utilizing the power of a small stream of water, having a great force of pressure, and consists of a wheel turning on a horizontal or vertical axis. Around the axis are made water chambers, in which water is admitted through pipes to force out the buckets through openings in the rim of the wheel, from which position they are withdrawn by friction rollers passing over the inner edges of involutes at the sides of the wheel. The water as it enters the chambers, acts on a series of pistons corresponding with, and at the ends of the buckets, but having an area, enough larger than that of the buckets, to insure their prompt action.

In our issue of Dec. 26th, 1868, we gave some information of a practical test of this wheel.

85,973.—IMPROVEMENT IN SASH-LOCKS.—William A. Sublett, San Francisco, Cal.:

I claim in combination with the detached ball C, and lever F, the slot E, narrowed both at top and bottom, and the catch P, for holding the ball against the upper incline in the lower sash, to fasten it down, substantially as described.

The object of this invention is to provide an improved device for supporting the sash of windows at any desired elevation, in such a manner as to preclude all possibility of their falling, unless it is desired to lower them by operating the device. It also relates to a mode of securing the windows when closed, so that they cannot be opened from the outside. In the casing opposite the sash, is an opening deepest at the upper end and tapering to the bottom, forming an incline slot, in which a round metal ball is placed, which falling to the lower part of the slot, binds the sash tightly, and prevents its falling. A lever with a projecting handle is so arranged, that by pressing down upon it, the ball is raised to a wider part of the slot and the window allowed to fall. A small catch is pivoted above the handle of the lever which may be turned down, and thus lock the sash so that it can not be raised until the catch is freed. Mr. Sublett is now manufacturing his device for sale. His invention is an ingeninus one, and attracted much attention at the last Mechanics' Fair.

86,007.—IMPROVED BRAKE BLOCK HOLDER. Arthur W. Dorr, Lake Valley, Cal.:

I claim the plate A, provided with the lip or flange a, and fixed jaw b, in combination with the screw B, and the movable jaw C, fitted in the oblong slot d, in A, and provided with the screw nut e, all constructed and arranged in the manner substantially as and for the purpose set forth.

86,008.—IMPROVEMENT IN TEA KETTLES.—Joseph H. Downing, Healdsburg, Cal.:

I claim the combination with the hail-kettle, formed after the fashion of a common tea-kettle, made of whatever material, the pieces D D, substantially as and for the purposes herein shown and described.

86,024.—HYDROCARBON BURNER.—N. May, and H. F. Stivers, San Francisco, Cal.:

1. We claim mixing the oil and water by means of the branch pipes C C', at the junction of the main pipe E, before it enters the fire and water-box or furnace, and the stop-cocks D D', for regulating the relative quantity of water and oil substantially as described.

2. The hydrocarbon burners described consisting of the tanks A B, pipes C C', uniting in main pipe E, chamber J, with pipes *a a*, furnace F, with cocks G, and plate H, the whole being constructed and arranged as described for the purpose set forth.

86,042.—IMPROVEMENT IN OMNIBUSES.—Henry M. Stow, San Francisco, Cal.:

1. I claim in combination with a single fore-wheel turning laterally upon an upright pivot shaft, which supports the front end of the body, and throws the weight thereof upon the axle of said wheel, a slotted tongue embracing said wheel, turning laterally upon the same center therewith, and extending back of the wheel, and its rear end having a movable connection with a segmental bar or way attached to the body, and receiving the strain of the draught substantially as described.

2. In combination with the subject matter of the foregoing claim, the friction wheel on the rear end of the tongue to lessen friction in turning.

86,086.—IMPROVEMENT IN PROPELLERS.—Alfred C. Loud, San Francisco, Cal.:

I claim the propelling wheel herein described, consisting of two or more disks secured in an oppositely inclined position upon a shaft, so that they meet at one point in their periphery, and are there united or joined together by bolts or otherwise, substantially as shown and described for the purposes specified.

RE-ISSUE.

3,274.—IMPROVED PAVEMENT.—Henry M. Stow, San Francisco, Cal. Patented December 10, 1867.

1. I claim a pavement, composed of alternate tiers of square-ended and wedge-shaped blocks, the wedge-shaped ends of the latter being driven into a foundation-bed of sand or earth, substantially as and for the purpose described.

2. A pavement, composed of blocks, with lower ends wedge-formed, and all driven down into a foundation-bed of sand or earth, substantially as shown and described.

3. A pavement, composed of wood, or in whole or in part of other suitable material, laid on a foundation-bed of sand or loose earth, as described, and a portion of the blocks driven down into said foundation-bed, to pack the same substantially as and for the purpose specified.

PREMATURE.—Several inventions having been noticed (inadvertently, no doubt) under the head of "patents," by the daily press, we are led to remark that when an application for a patent is merely *allowed*, the invention is not *patented*, and will not be until after the government receives an additional fee. This the inventor frequently—intentionally or inadvertently—neglects to send, and a patent does not issue. Until a patent *issues*, or the application is perfected, the invention is treated as confidential at the Patent Office, and (except in special cases) it is unusual to report publicly cases at this stage, as it might often prejudice the interests of inventors. The earliest reports of the *full list* of patents issued to inventors of this coast are received by this office, advanced direct by order of the Commissioner of Patents, for which we pay a liberal sum, and to give inventors and the public the benefit of it at the earliest moment, it is forwarded to the daily press before it appears in our own journal.

RESOURCES OF THE PACIFIC SLOPE.—Appleton & Co., New York, publish a massive octavo volume of nearly 800 pages, under the title of Resources of the Pacific Slope, by J. Ross Browne, which embodies besides the mineral resources of the States and Territories west of the Rocky Mountains, heretofore noticed, a sketch of the settlement and explorations of Lower California, etc., from notes by Gabb, Loehr, and Browne, taken on their tour in the interest of the Lower California Land and Emigration Society.

THE ADVERTISING ANNUAL for 1869, of Hudson & Menet, of No. 41 Park Row, N. Y., and 626 Montgomery street, San Francisco,—a beautifully printed little pamphlet,—has been sent to us, and is found valuable in virtue of its list of the newspapers of the Pacific coast; containing besides, articles of interest to advertisers and business men.

THE MANUFACTURER AND BUILDER.—Western & Co., of No. 37 Park Row, publishers of the New York *Journal of Mining*, have issued the first number of a monthly illustrated periodical of the above title. It is a credit to the printer's and engraver's arts, no less than to the judgment of the editor. The price is $1.50 per annum.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

NORTH BLOOMFIELD GRAVEL MINING Co. Nevada County. Jan. 23d. Capital stock, $800,000; 8,000 shares, $100 each. Trustees: L. L. Robinson, S. F. Butterworth, Thos. Bell, R. Bayerque and W. C. Ralston.

PACIFIC UNION GAS Co.—San Francisco. Jan. 23d. Capital stock, $100,000; 1,000 shares, $100 each. Trustees: David Simpson, James Atkinson, Edward C. Lovell, W. Fisher and Chas. Halsey.

MUTUAL BUILDING ASSOCIATION.—San Francisco. Jan. 23d. Capital stock, $250,000; 2,500 shares, $100 each. Trustees: Howard Chapman, Matthew Bridge, J. W. Ackerson, J. A. Ross, Chas. Harrison, Wm. B. Lake, Joel S. Josselyn, D. A. McDonald and Joseph McGill.

UNION LABORERS' ASSOCIATION.—San Francisco. Jan. 25th. Trustees: Lenpold Dubereau, P. F. Clerc and Nicholas Guille.

IDA S. M. Co.—White Pine, Nev. Jan. 28th. Capital stock, $320,000; 3,200 shares, $100 each. Trustees: W. H. Burnett, W. A. Lampe, R. A. Boyle, H. Kaster and S. E. Oakley.

PALMER S. M. Co.—White Pine, Nev. Jan. 28th. Capital stock, $400,000; 4,000 shares, $100 each. Trustees: J. S. Silver, W. A. Lampe, R. A. Boyle, Henry Kaster and S. E. Oakley.

LEXINGTON M. & M. Co.—White Pine, Nev. Jan. 29th. Capital stock, $1,600,000; 1,600 shares, $100 each. Trustees: R. A. Hawkins, F. Lux, J. W. Tabor, P. Chamberlain and W. B. Latham.

SAN FRANCISCO AND WHITE PINE M. Co. White Pine, Nev. Jan. 29th. Capital stock, $600,000; Trustees: A. Meyer, J. R. Bidleman and T. D. McKeun.

BRODT S. M. Co.—White Pine, Nev. Jan. 30th. Capital stock, $500,000; 10,000 shares, $50 each. Trustees: A. W. Whitney, Otto Kloppenburg, Coll. Deane, Matthias Van Winkle and Martin Scheper,

LAND PURCHASERS' ASSOCIATION.—San Francisco. Jan. 30th. Capital stock, $100,000; 200 shares, $500 each, with right to increase to $400,000. Trustees: J. F. Crosett, C. J. King, George Spaulding, D. CITY FRONT FERRY Co.—San Francisco. Feb. 4th. Capital stock, $500,000; 5,000 shares, $100 each. Trustees: Samuel Tyler, Chas. M. Tyler and Henry F. Williams.

A SCARE FROM BURNING GIANT POWDER. Quite a scampering took place among the hands working in the Ida Elmore mine one day last week, occasioned by one of the men accidentally dropping a lighted candle into a box containing several pounds of Giant Powder. On learning of the accident, the men who were working near the scene at the time, broke furiously for the shaft, expecting every second to be blown into the middle of next summer, and it is well they did so, for the fumes arising from the burning powder were intolerable. All of the men were more or less affected by the terrible stench before they could be drawn up, and two of them were so nearly suffocated that they were not able to resume work for several days.—*Owyhee Avalanche, Jan. 23d.*

Giant Powder contains the same chemical ingredients as nitro-glycerine, with the addition of some silver, whereby it is transformed from a fluid into a solid substance, and rendered less susceptible of voluntary decomposition, or of accidental explosion from any slight percussion. It is identical with the dynamite.

One of the objections to nitro-glycerine in the mines where it has been used, is the injurious effection the health by the fumes generated.

Weekly Stock Circular.

By Associated Brokers of the S F. Stock and Exchange Board.

San Francisco, February 6, 1869.

Financial.

Our local money market works easily and smoothly, with a fair prospect for continuance. It is a great blessing to be free from the convulsions and spasms which affect those money marts where paper currency has usurped the places of gold and silver. Rates, in bank, remain steady at 1@1¼ per cent. per month, with quite an active demand, and abundant supply. Although we have been favored with steady and copious rains, communication with the interior has not been obstructed to the extent it attained at this time last year, and bullion has been furnished in fair quantities. We quote gold bars at 880@890 ; silver bars sell from par to ¼ per cent. premium ; currency drafts on Atlantic cities command 33@33¼ per cent. premium on gold; sight drafts, payable in coin, 1¼ per cent. premium; telegraphic transfers, 1¼ per cent. premium; sterling exchange, 48¾d; commercial, 49@49¼d; Mexican dollars are selling at 5@6 per cent. premium,

Our rain fall, so far this season, has been 12¾ inches, and quite sufficient to insure the growing crops, which are on a scale far more extensive than ever, besides possessing the advantage of being, in good part, on new and strong soils, while the volunteer crops on lands planted last year are much superior to those in Eastern States grown on lands cultivated with much labor and skill.

Next Monday, the 8th inst., our Branch Mint will resume operations. It is as well to remark, in this connection, that we regret to learn the intention to erect a Branch Mint at the Dalles, where it will remain a monument of reproach to Congress, for permitting partisan legislation to baffle the best interests of the people at large, and waste the public moneys to feed a small army of political leeches.

The real estate mania has again fastened its grip upon our people. The value of sales made in January was $2,716,823, and the number 492, being eight more in number, and $1,110,064 more in value than in December last. More business was done in this line during January, 1869, than in any one month of 1868, with the exception of March and September. The Potrero lands were largely dealt in—no less than 121 sales, involving $250,667, have been effected. Two hundred and sixteen mortgages, to the value of $1,185,221, and 157 releases, representing $588,960, were recorded in January last. The market has opened briskly, with every prospect of increased transactions. If the sales in January of the present year, when compared with those for the same month in 1868, afford any index of the real estate business to be transacted in 1869, we may set it down at not less than $50,000,000.

City Stocks.

Our city stocks commanded improved rates during the period under review, and at the close the market is very firm. Seventy shares of Spring Valley Water stock sold at $67 and $68, buyer 30. This company pays its usual monthly dividend on the 10th inst. Early in the week a few shares of North Beach and Mission R. R. sold at $69, and later fifteen shares were disposed of at $70 ℔ share. Gas stock exhibits a very material rise, twenty shares selling on the 3d at $90, seller 3. The usual monthly dividend was paid on the 1st inst. The Pacific Bank paid its customary monthly dividend on the 1st, and the Merchants' Mutual Marine Ins. Co. will disburse its usual dividend on the 10th. At the close, Cal. Steam Navigation Co. stock sold at 65½ per cent.

Mining Share Market.

The mining share market proved to be quite active since our last similar reference. This activity is mainly based on the prospective developments, of which limited success has so far attended several companies on the Comstock ledge, among which we may mention the Belcher, Yellow Jacket and Hale & Norcross, though the latter does not look quite so well at latest dates. Should Ophir prove to reach successful results in drifting from the lower level of its new shaft, we may expect to see a marked improvement in share values.

Belcher—has been remarkably active since our previous issue, rising to $34, and closing at $32. A telegram of the 4th inst. reads: "Assay from 200 level, $72; and 335 level, $69 to the ton." The ore reached in the 335 level, it is expected, will be found in the new exploring drift on the 420 level, arguing from the fact that they have tapped a heavy body of water at the last named point. The ore found on the 200 level lies east of the shaft, toward the Segregated Belcher ground, and arrangements have been perfected with the latter company to raise this ore through their shaft.

Hale & Norcross—maintained its activity throughout the week under an advance up to the 2d inst., when it sold at $85, the next day dropped to $70, and at the close realizing $66. The letter of the 2d states that the ground floor north in the south breast shows more waste than it did the day previous. The second floor continues about the same as previously reported. At the above date they had not yet reached the face of the south drift. In the north drift they found a little ore west of where they crossed the ore with the cross drift, and had not yet gone far enough to get into the ore body. On the 3d the ore in the winze was wider—about four feet—but not of very high grade. The south drift had been opened, and they are now running on a stratum of ore about two feet wide, and also running a cross-drift westward.

Crown Point—sold at $67@68, and closed at $67. On the 31st ult. the sump was fourteen feet below the 1100 level, to which point the pump column has been extended. The east drift of the 1100 level is in 40 feet, running in hard rock. The south drift of the 900 level is in 425 feet from the north line, the face showing clay and phophyry. The extension of the main northeast drift is now over thirty-seven feet east of the east clay, the face of it in granite. Over $28,000 in bullion received on January account.

Kentuck—declined from $232 to $200, and closed at $205. The receipts of bullion for January account foot up $69,359....Overman rose to $84, and closed at $77. It is reported that a good supply of ore is on hand, and that both mills are kept running. The receipts so far upon January account aggregate $21,000. ....Amador (Cal.) advanced to $260, on the 4th instant. The reports from this mine are encouraging. A dividend of $6 per share is payable on the 10th inst. The date for paying dividends has been changed from the 20th to the 10th of the month. Receipts of bullion for January amounted to $47,861, against $46,000 in December. Joel F. Lightner has been elected Secretary of this company in place of Col. Bicknell, resigned, who, we understand, will become connected with Mr. Downey's bank at Los Angeles.

Imperial—has been in moderate request, selling at $144@149 50, and closing at $138. The aggregate receipts of bullion in January amounted to $46,728, against $44,288 in December....Chollar-Potosi has been inactive, realizing $167@171, then selling at $163, and closing at $163. During the week ending January 29th, 919 tons of ore were extracted. The drift at 920 level, of the new works, is in 120 feet, and the drift west from the 1100 level is 64 feet long—all made through porphyry. They have about 64 feet further to run before the west wall will be reached.....Yellow Jacket rose from $1,452 to $1,575, and closed at $1,580. It is believed that at the meeting of the stockholders on the 5th inst. it will be decided to retain the office of the company at Virginia, and that the capital stock will ho changed from feet into shares.

Ophir—advanced from $37 75 to $42 50, and closed at $43 50. On the 3d inst. the shaft was timbered to a depth of 712 feet, and the whole depth exteuded nine feet further. Two more sets of timbers will be required in order to complete the sump, and this they expected to have finished at this date....Gold Hill Quartz shows a bullion yield of $6,956 42 during the month of January. The amount reduced was 339 tons, equal to $20 52 per ton....Eureka, (Cal.) sold on the 30th ult. at $230. The yield for January amounted to $36,210 23.

Overland and White Pine Stage Connections.—W. H. Cottrill, agent of the Austin division of the overland mail route, states that on and after Tuesday, February 2d, the overland stages will connect with the railroad at Elko, instead of Argenta, as now. The new route will follow tho road recently built from Elko to tho White Pine district, and will fall into the present route of the overland mail at Jacob's Wells, some distance east of Austin. Until all arrangements are perfected, the White Pine travel by Wells, Fargo & Co's stages will continue to go by the way of Austin.

At Vallejo and Benicia the *toredo navalis* (shipworm) cannot live, the water being too fresh.

Save your eyesight, by procuring a pair of C. Muller's famous Brazilian Pebble Spectacles. His place is at 205 Montgomery street. *

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Sewing Machine Feeder.—The patent held by A. B. Wilson for the "four-motion feed" used in all family sewing machines for feeding along the cloth, expired on the 19th of December last, and Commissioner Foote has refused to grant an extension. It is ascertained that the actual cost of manufacture of a good machine is only from $10 to $14, while the retail price is $60.—*Exchange.*

There never yet was a case of Dyspepsia too obstinate to yield to the persistent use of this pure vegetable tonic, Plantation Bitters. It gives a new impulse to the whole digestive apparatus. The stomach, reinvigorated by its operation, rapidly turns to nourishment the food that would otherwise have lain for many hours a dead weight there, the work of assimilation is duly performed, the sympathetic brain and nervous system recover their vigor and activity, the animal spirits improve, and the whole being, corporeal and mental, is refreshed, strengthened and regulated. Such are the effects of this wholesome vegetable remedy, at once irresistible and harmless. *

Exportation of Ores from Mexico.—The last mail from the City of Mexico brought news that on the 7th instant Congress finally passed, by a vote of 97 to 20, the bill which permits that all kinds of ores can be exported free of duty.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Jan. 23d: The roads are now good and the material for the M. C. M. Co's flume is daily arriving on the ground.

The Mt. Bullion tunnel, which has for a long time been running in hard rock, is now encountering that of very easy working texture. Good time is now being made toward the belt of ledges it is intended to open.

The shaft of the Morning Star is going down now at the rate of two feet per day.

AMADOR COUNTY.

Jackson *Ledger*, Jan. 30th: The Pine Grove correspondent writes: The hoisting works on the Anaconda mine are complete in every sense, and the work of sinking is being vigorously prosecuted. Mr. Shultz has purchased the Thoss sulphuret works, on Else Creek, and is adding a 5-stamp mill thereto.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, Jan. 30th: The Railroad correspondent writes: Last week one of the richest discoveries ever made in any country—a regular "White Pine mine"—a lode four feet wide and fairly sparkling with gold, was unearthed. The lead is located near the mouth of Wet Gulch, on the steep side hill, some 600 ft. above the bed of the gulch. The rock is of unexampled richness.

Herzier & Everhardt are working a very promising lead, a little north of Independence. They have a shaft of 25 feet in depth; lead, 20 inches. Gamble & Co., in the same locality, have also a flattering prospect. Mr. Doe and a number of others have recently struck it rich.

Mr. Smart will soon have his mill in readiness to run. E. J. Reynolds & Co., while sluicing, have discovered a very rich quartz lode within a stone's throw of Independence.

The Chili Gulch correspondent writes: Matthews, Foster & Co's lead, near Whisky Slide, have a shaft sunk to the depth of 138 feet, with a solid vein of quartz, varying in width from three feet near the surface to eight feet at the bottom of the shaft, while the rock taken out while sinking, will work $9 per ton. The well-known Whisky Slide lead has three shafts sunk on it in different places, respectively, 40, 85 and 100 ft. in depth, showing a vein of quartz from 3 feet near the surface to 18 feet in width at 100 feet in depth, while the last rock worked from this mine paid, on an average, $14.44 per ton.

The Junction correspondent writes: Work on the Palomo mine is being pushed ahead most vigorously, and judging from appearances, success is sure to crown the efforts of the company. Work at the Quaker City mill is for the present in a great measure suspended.

INYO COUNTY.

The Los Angeles *Star* says it notices two ingots of fine silver bullion from the Wolfskill & Cervantes Mining Co., of Lone Pine, Owens' River, Inyo County. One of the ingots weighed 87.86 ounces, and assayed .905 fine; the other was 85.50 ounces, .985 fine. We understand the mine is in fine working order, and that the ore is easily extracted and very free in working.

MARIPOSA COUNTY.

Mail, Jan. 29th: We learn that the prospects of a rich result from a second run of the 8-stamp quartz mill of the Mt. Buckingham Co. and prospective cleaning up, which will take place in a few days, after the crushing of 100 tons of ore taken from the vein, ten feet wide, as it comes out, is very flattering. This mine contains an almost inexhaustible amount of quartz rock, easy of access and bringing to the surface, more so than any mine that we have heard of. The next cleaning up will be a fair test of its paying qualities.

Gazette, Jan. 29th: On Friday last we paid a visit to the Benton mills. Here we found everything lively and everybody busy. We were shown through the new quartz mill which is just completed. The mill is worked by water-power, has sixteen stamps, and is intended for dry crushing. The machinery for the Thunderbolt crusher is now at the mill, and will be put in running order in a short time. It is claimed that the Thunderbolt will crush from 30 to 40 tons of rock per day. The company have another mill just below the new one. It is in operation and running 16 stamps. There is on the yard at the mill, some 1,200 tons of rock taken from the Josephine and Pine Tree mines.

While at Coulterville recently, Robert McKee exhibited to us some fine gold-bearing quartz ore, recently taken from his vein. After running a tunnel some 200 ft. he struck the vein which is about four feet thick, and shows gold freely throughout. Ralph Jones is prospecting a mine about two miles below the town of Coulterville; he has a shaft already sunk 90 feet on the vein, which looks well and encouraging. He has a small water-power mill of five stamps, and is now engaged in crushing some of the inferior or refuse rock. Should the experiment justify him in so doing, he will make additional improvements, which will give employment to quite a number of men.... Roberts & Co. have taken the Melvina vein, and are working the same on shares. This mine has not been worked for some time past. There are parties prospecting the vein near Coulterville.

NEVADA COUNTY.

Transcript, Jan. 27th: Townsend & Co. have located 4,000 ft. on Green Horn Creek, for mining and fluming purposes, extending from Townsend's house to Knickerbocker Ravine.

After a week's run the Idaho mine yielded 508 ozs. of amalgam worth $9,000.

A short time since two miners struck a pocket in a ledge near the mouth of Wood's ravine, and in a few days took out a little over $300.

The Cornish Co. on Deer Creek, below this city, is doing very well. The lead is owned by Cornishmen who do their own work. The mill is kept running with one man and four boys, and the owners keep it supplied with rock. The rock is exceedingly rich in sulphurets, and the ledge is large.

Jan. 28th: Five quartz mills are in operation in Enreka district, and will be kept running all the winter.

The recent storm has been exceedingly favorable to the mining interests, and if it is not followed by freezing weather the water supply will be fully adequate for mining purposes, for some time.

For some months past work has been suspended in the Banner mill and the improvements are now nearly completed. Ten stamps have been added, making 40 in all, and the old engine replaced by a new one of 140-horse power. It is expected that on Monday morning the mill will be ready to commence crushing. The mine is looking first rate, is thoroughly opened and will yield abundance of rock to keep the mill continually at work.

Jan. 31st: Fogarty & Co. have located 2,800 ft. on the South Yuba river, commencing at Holt's old crossing, and extending up the river, for mining purposes.

Gazette, Jan. 28th: The winter thus far has been unusually favorable for creek mining. The rains have not been excessive enough to fill up and obstruct operations in the bed of creeks and ravines, while at the same time there has been a sufficiency of water for the owners of claims to work them steadily. Scarcely any damage has been done by the storms in the way of sweeping away flumes, filling up excavations or disturbing temporary water wheels for raising water from below the beds of streams. Below Nevada, on Deer Creek, a large number of miners are actively at work cleaning the bed of the creek and sluicing out the accumulated tailings.

Walter Dikeman, aged 10 years, and a son of S. Dikeman, of Rough and Ready, found a lump of gold worth $28 a few days ago, near his father's residence; and a day or two later his younger brother found a smaller piece. The boys immediately located claims, and have since been at work digging a ditch to bring in water. They refused to suspend work during the late storm and are so excited and anxious to commence sluicing, that they can hardly be induced to take sufficient sleep.

Jan. 29th: The Enterprise Co. on the north side of Deer Creek, near the Cascades, struck pay gravel in the claims a few days since. This company has been running a bedrock tunnel for the past two years, with the expectation of striking a gravel channel. They were in a distance of about 340 ft. with their tunnel, and all the members of the company being poor men, they were much discouraged in not finding the channel as they had anticipated.

Grass Valley *National*, Jan. 25th: We saw this noon at Findley's bank a bucketfull of gold, hot from the retort, which weighed 508 ozs., and is worth about $9,000. It was the product of one week's run from the Idaho mine.

Jan. 29th: The Surprise Co. have located the bed of Green Horn Creek for 500 ft. below the falls. The Elevator Co. have located 2,400 ft. on a quartz ledge at Dead Man's Flat, Rough and Ready township.

Several stringers have been found in the tunnel of the Providence ledge, and the rock in them shows well in gold and sulphurets.

Grass Valley *Union*, Jan. 27th: A few days since the Roannaise Co's claims, situated in this district, was sold to the Enreka Co. for a large amount in coin. The Roannaise Co's claims are on the Enreka ledge, and adjoin the claims of the Enreka Co.

The mining claims situated in Glenbrook Park Race Course, half way between this place and Nevada City, may be considered as good ground. They are worked when water can be had by hydraulic pressure, and paid last winter $10 per hour for every hour they were worked. So far this winter the claims have not been steadily worked, as water has been scarce. The last two or three days' rain will enable the owners to take out the metal.

Jan. 28th: Hydraulic mining to any great extent has been suspended in Enreka township until spring.

The Idaho is working in rock, on the 300 feet level, the richest which has yet been found in their mine. With 15 stamps the Idaho is turning out from $8,000 to $12,000 per week. The sulphurets are not worked, as yet, but are saved, which will add considerable to the actual yield of the mine.

The Empire mine, on Ophir Hill, is also in better average rock than they have ever had before.

The Allison Ranch mine will surely be worked again, and started up early in the spring.

Frank Morse will have the old Larimer mill in running order by the end of this week. The mill will run on the rock taken from the Higgens and Larrimer ledge.

From the Union Hill mine yesterday, was brought to Findley's bank $5,610 worth of gold, the proceeds of 50 tons of rock, from the lower level.

Jan. 30th: The Coe has been stopped for several weeks and the underground arrangements have all filled with water. Two or three days ago, the pump was started up and run for the purpose of clearing the shaft so that parties could go down to inspect the ledge, with a view to the purchase of the mill and mine. The ledge shows well and is thought to be rich.

PLACER COUNTY.

Auburn *Herald*, Jan. 30th: We were shown on yesterday, some rock from the Mammoth mine, upon which the Pioneer mill has been erected, and is now crushing some eight or ten tons per day, which shows free, bright gold to the naked eye, in numerous places. This gold seen is in the solid white quartz, and not found in seams and cavities where the sulphurets have been destroyed, as is usually the case. There is much honeycombed quartz in the ledge, which is rich in gold, and also contains some base metals. The ledge is 16 ft. wide, and the piece we saw came from a depth of 45 ft. The mill is about 400 ft. from the shaft, the two being connected by a railroad track, and two men quarry and deliver at the battery some eight or ten tons per day.

SISKIYOU COUNTY.

Yreka *Union*, Jan. 23d; The cold weather during the past week has stopped pretty much all mining in this immediate vicinity. To avoid disaster to the Shasta River ditch from the accumulation of ice in it, the water has been turned out of it.

TUOLUMNE COUNTY.

Sonora *Democrat*, Jan. 30th: James T. MacLean, has taken a contract from the company to run 500 ft. of the Kincaid Flat tunnel. This will take the tunnel through the ridge and into Kincaid's Flat. The rock is much harder than was expected at the commencement of the enterprise.

YUBA COUNTY.

The Marysville *Appeal* says: The Babb Mining Co., of Timbuctoo, cleaned up a portion of their flume last week, taking out $6,350, after a run of 20 days. They estimate that by cleaning up the whole flume they would take out $8,000 to $10,000. This claim is situated about one mile from the Blue Gravel claim of Smartsville, and on the same lead or river channel. There are several companies working on different portions of this channel between the Babb and Blue Gravel claims. Our mines will not be exhausted till this extensive body of gravel and cement has been washed. The companies at the present time working, and in fact owning nearly all this ground, are J. O'Brien, McAllis & Gordon, Excelsior Canal Co. and the Pittsburgh Co. All the above companies are realizing fair results from their labor; still the great drawback is that none of the above claims are sufficiently low to work their richest and best gravel.

NEVADA.

HUMBOLDT.

Unionville *Register*, Jan. 23d: We were shown on Thursday some samples of ore taken from Gov. Fall's claim, on the Arizona mine, that were richer by far than anything we have heretofore seen from the same ledge. A very large body of this kind of ore was struck by the workmen in the mine.

Silver M. Co. shipped this week 1,044 ozs. of bullion, and Fall & Co. shipped 1,500 ozs.

Jan. 30th: A respectable little mining excitement has been developed over the mountain in Panther Cañon, growing out of the discovery of a rich mineral bearing vein not far from the Alpha mine, and supposed to be on the same lode. Several assays were made of ore taken from the new location, which ranged all the way from $50 to $1,100 to the ton. The ledge is described as being about three ft. thick and the ore considerably decomposed.

A short time since the workmen in the Arizona mine were set to work drifting to the westward from where the tunnel first strikes the lode, and had gone but a few feet when their labors were rewarded by striking a body of ore surpassing in quantity and quality anything yet found in that mountain; and on Wednesday, the hanging wall had not been reached, although the miners had cut into a body of ore eight feet thick. In the whole of this mass of ore there is none that is thrown away, but all is sacked and hauled to the mill for reduction. Should this heavy body of ore continue to the northwestward, as now indicated by its general appearance, new mills will be needed in the spring to crush the ore as fast as taken out.

Silver M. Co. shipped this week 3,112 ozs. of bullion.

The Winnemucca correspondent writes: Fox & McBoth, on Monday last, shipped 10,000 ozs. of bullion from the Little Giant mine in Battle Mountain, which was the result of 17 days' work with a 4-stamp mill.

T. G. Negus shipped three bars, valued at $2,000, from the Golconda mine.

REESE RIVER.

Austin *Reveille*, Jan. 23d: We saw to-day at the office of Boalt & Stetefeldt two large bars of crude bullion, or matte which were brought from Hot Springs or South Columbus district. The matte is a sample of some five tons smelted and ready for shipment. The bars are .87 fine in silver.

We were shown two pieces of the ore taken from the tunnel of the Great Eastern mine at Ophir Cañon, Twin River district, which appears to be identical with that produced in the lower workings of the Murphy.

The Great Eastern has been relocated under a different title by a party of Portuguese miners, who are working the mine with spirit and industry. In the tunnel which they pushed over 100 ft. into the hillside it is said they cut a vein of ore nearly 15 ft. thick.

Mountain *Champion*, Jan. 23d: Water was reached in the main shaft of the El Dorado South, in the Silver Bend district, a few days previous, and a body of immensely rich ore partially uncovered.

We learn that Col. Buel is daily taking ore of a very high grade from the Transylvania and Highbridge mines of the Belmont Co., and that there is on the dumps of those mines and at the mill between 200 and 300 tons of first class ore.

WHITE PINE.

Treasure City *News*, Jan. 23d: The late cold spell of weather has materially interfered with prospecting in this district, yet some there are which neither wind nor weather can daunt.

We saw the deed of the Little Phil. Sheridan mine, located near the Pocotillo, conveying it to a San Francisco party, for a very respectable sum.

We learn that Coover & Co's new 5-stamp mill in the ravine on the northeast side of Treasure Hill has got under way. Moore & Co's 8-stamp mill at Silver Springs will start up during the first week in February.

The bank of John A. Paxton shipped during the months of November and December 1868, $96,711.28. The agency of the First National Bank of Nevada, shipped $101,535.14 during the same period. Total shipment, $198,246.42.

The White Pine mill located at Hamilton has been for sometime undergoing repairs to the boiler. Mr. Miller, the agent in charge, informs us that everything will be completed and running again on Monday, turning out bullion as usual.

The O'Neal & Quinlan mine near the base of Treasure Hill, is a well-defined ledge, three feet or more in thickness, and composed entirely of good ore, so far as opened, of a high grade.

The shaft in the Keystone mine is about

80 feet in depth, starting 15 or 20 feet from the north wall. At a depth of about 70 ft. the shaft strikes this wall and follows it down a distance of ten feet, from which point drifts have been run east and west, following this wall a distance altogether of about 100 feet. The Keystone mine has furnished the richest specimen of silver ore we have seen—the one in Paxton's Bank is worth some $1,500, and about as big as a water bucket.

Virginia *Enterprise*, Jan. 26th: For some days we have heard but little said about White Pine. The heat of the fever appears to be over for the present. Some who have lately come from that region say that the country is already overdone, and predict that one year from to-day the population will be one-third greater than at present.

Treasure City *News*, Jan. 30th: There is nothing at present of which White Pine district stands so much in need as that of mills and other ore-reducing facilities. The dumps on Chloride Flat are nearly all so piled up with ore as to interfere with the successful working of those mines, owing to the fact that no sufficient means of reducing ores can be obtained within a reasonable distance.

The Mary ledge has been opened four or five feet, but is apparently much wider than that. The ore contains copper, lead and antimony, together with silver chlorides. A great many assays have been made, which leave no doubt that the entire vein will yield over $100 per ton.

The Galena mine is the largest and most valuable in the Base Metal Range. It has been opened in several places, all of which yielded excellent ore showing the vein to be 100 feet or more in width. Assays as high as $1,700 per ton have been obtained, and a few tons worked by mill process yielded $152 per ton, notwithstanding there is considerable lead, copper, antimony, and other base metals combined with the chlorides, preventing the amalgamation of the silver by the ordinary mill process. So far as the vein has been opened the entire ore will yield an average considerably above $100 per ton.

The Oasis mill, since the 10th inst., has been running on third-class ore from the Eberhardt, which pays only about $400 per ton. A few days ago, workmen completed the laying of 3,000 feet of 3-inch galvanized iron pipe, for the purpose of conveying an additional supply of water to the mill.

Ore from the Dell mine on Pogonip Flat, works by mill process $256 per ton.

On Wednesday last, at the assay office of T. M. Luther, in Silver Springs, we saw ten bars of bullion, .985 fine, worth about $20,000—a portion of the proceeds of third-class ore from the Eberhardt, worked at the Oasis mill this month.

The Butcher Boy ledge, near this place, is yielding pay ore in large quantities and of good quality.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Jan. 27th: The Gold Hill Co. have completed a substantial car-track from the mouth of their tunnel to their mill on the opposite side of Main street. The ore is now run from the mine directly to the mill.

Jan. 28th: During the week ending last Friday, 900 tons of ore was taken from the Chollar Potosi mine, averaging $43.67, from the stope, and $26.48 per ton from the cut. On the 22d the company shipped bullion to the value of $6,688.

The Birdsall mill, Dayton, which has been idle for some two weeks, started up on Tuesday, on ore from the Occidental mine. They now have on hand an accumulation of between 1,400 and 1,500 tons of Occidental ore, and unless a very severe storm should occur, the mill will be kept constantly going to its utmost capacity for the next six weeks, or until spring.

Jan. 30th: There was shipped by express from this city during the past week 4,614 pounds of bullion, valued at $126,555.89.

Jan. 31st: The Chollar Potosi Co. yesterday shipped $14,509.50 in bullion.

BRITISH COLUMBIA.

Portland *Oregonian*, Jan. 23d: A gentleman of this city who has business connections with the Kootenai mining region, has just received letters containing information of the most encouraging character, concerning the mining prospects of the coming season. The permanence and richness of the mines are becoming so well established as to attract many of the pack trains which have hitherto been trading to the Blackfoot country. There will be in the spring at least seven trains withdrawn from the Blackfoot route and placed on the road from Walla Walla to Kootenai. It is confidently expected that the yield of gold and the general prosperity of the Kootenai country for the coming season, will be far greater than of any previous year.

COLORADO.

Central City *Register*, Jan. 14th: The first class ore of the Flack mine taken out during the last month was sold to Prof. Hill for $172 per ton. The second class ore averaged about six ozs. of gold per cord.

B. C. Waterman has been putting up a new mill at the head of Eureka Gulch.

Some 500 ozs. of silver were shipped to Denver yesterday, from the works of Hinpeden, Wolters & Co., Georgetown.

From a friend recently from the Arkansas, we learn that mining operations in Granite district are quite active and promising. The winter, thus far, has been mild, with very little snow. Mr. Felton is running his mine and mill regularly, and with very good success. His mine is 115 feet deep, and is yielding very good ore in reasonable quantity.

Central City *Herald*, Jan. 13th: A quartz mill is being put up on Fall River with a view to crushing ore from Russell and Nevada.

A report has been current on the street for the last few days that the Bobtail Drainage Co. intend to shut down. This will stop work on the Bobtail Hill. Also, in the Gregory, Briggs, Smith & Parmelee and Black Hawk mines. Over 300 men will be thrown out of employment.

IDAHO.

Owyhee *Avalanche*, Jan. 23d: Richer ore than ever is now being taken out of the Ida Elmore mine. The main or south shaft is down nearly 100 ft. A new level has been formed at a depth of 80 ft.; a depth of about 60 ft. has been attained in the north shaft, and we can safely assert that at no time in the history of this celebrated mine have the indications been as brilliant as at present. The Ida Elmore mill is kept humming night and day on this ore.

Work is progressing rapidly on the Golden Chariot mine, and huge piles of glittering ore are the results. The Owyhee mill will be employed on it next week.

The Poorman ledge is increasing daily, in quantity and quality; the yield now averages about 40 tons per day of excellent rock. The casing of the lode is, and always has been, very soft and easily worked, none but picking ground has been encountered, and the services of powder is hardly ever required. The Owyhee mill is at work on the ore with good results.

Work has been done on the Minnesota lode. Several hands are employed sinking a shaft, and it looks exceedingly well. Some as rich ore as was ever extracted from any mine in the camp came from this lode.

A shaft is being sunk on the Baxter lode, and occasionally extremely rich ore is disclosed.

Tierny & Co., on the south extension of the Oro Fino, are busy sinking their shaft and the lode looks well; the rock obtained is of a similar character to that of the Ida Elmore.

We have been informed of another rich strike not many miles from town, but owing to some complications we are not at liberty to give particulars at present.

Silver City *Tidal Wave*, Jan. 19th: The Woodstock has had a fine clean-up at the Cosmos mill. We saw a large brick at Blake's, but as it was not yet assayed was of no particular known value.

Uriah Perry, of the Iowa Co. in Flint, came over on Saturday with 1,100 ounces crude bullion, the product of four days' run in Black's 5-stamp mill, $100 per ton and upwards. Perry makes Black's mill play on Rising Star ore.

The John Jacob Astor ledge at Flint, is developing finely. Their tunnel is now in 115 ft., which gives them a depth of 35 ft. The ledge is four ft. wide at this depth and fully equal to the ore that gave $165 per ton last fall, mill process.

The finest body of ore yet struck in the Rising Star mine showed itself on Thursday about 190 ft. below the surface, the whole body of the ledge being very rich at that point in ruby silver of a very high grade.

Jan. 23d: From a gentleman who has just returned from South Mountain we learn that the new mines now being worked there look very promising indeed. The Galena and Original are very wide and rich ledges; and the Young America, a later discovery is said to exhibit some of the finest prospects of any lode yet discovered on this coast. The lode is 12 ft. wide and the ore assays $208 per ton.

The Golden Chariot is taking out rock in large quantities. The Owyhee mill will start on Chariot ore to-day.

MONTANA.

Helena *Post*, Jan. 8th: The strike has subsided, the miners employed by Mr. Hodge have resumed work at the old price of $50 per month, and Mr. Tatem's men have expressed a willingness to do so as soon as he hears from the East. All the differences have been arranged satisfactorily.

A ditch is to be brought into Pony Gulch to convey water from the right hand fork of Willow Creek. This ditch is about 2¼ miles long and has capacity of some 500 in. of water.

The future prospects at Diamond City are brighter than ever before. The prosperity of Diamond City has been the result of her very wealthy placer claims which have yielded to the owners great wealth. These placers are not worked out but will give employment to a large number of men for years to come. We have examined several specimens from the Durant lode, shown us by Mr. Cook, and they are indeed splendid. We have examined specimens from other lodes and we are prepared to believe that there are no better quartz leads in the Territory than can be seen to-day in the vicinity of Diamond City. Mr. D. W. Corbin, the owner of the Durant lode, is at present East, engaged in procuring a splendid quartz mill, which he intends having in full operation by the first day of July next on this lode.

The Phillipsburg correspondent writes: Taking a tour through the mines, I found the miners busily at work everywhere, and in high spirits. The deeper they go the better their leads are. Up the gulch I came first to Mr. Freeman's shaft 110 ft. deep. Then comes John O'Leary's shaft shaft 30 ft. deep. They have excellent ore. I visited the Belle Flower and the Irish Republic where an immense amount of labor has been performed. A fortune is in sight in each of these lodes. These deep shafts and good veins are assurance that the ledges are permanent. I also visited Alexander's tunnel, where he and Mr. Edgar were taking out rich and beautiful ore, and the Hope lode, and was astonished at the richness of the ore that comes out of the deep shaft sunk by James Stuart. On the San Francisco, Estell & Freeman were at work. This lode is in the granite and looks well. Proceeding to the shaft on the line between Nos. 2 and 3 on the Rumley & Bugher lode, I found this opening looking fully as well as discovery. This immense lode is now open to the extent of 1,200 ft. in length, and the narrowest place in it is 27 ft. This lode and the Hope have been tried in the mill and their owners defy any other lodes in Montana to equal them in richness and extent. Work is going on universally throughout this camp, except on those tunnels and shafts which were run last winter to the great bamboo chief—the Comanche. That work is now suspended.

NEW MEXICO.

Santa Fe *Gazette*, Jan. 9th: The report of Col. Darling's expedition during the survey of the boundary line between New Mexico and Colorado, says: Gold and silver mines abound in the Sierra Navajo, San Juan, Las Animas and La Plata ranges of mountains. They have all been indifferently prospected, but on account of the active hostility of the Utes, very little is actually known of their immensity or capacity.

Central City (Col.) *Register*, Jan. 14th: Maxwell's mill, Cimarron, cleaned up on the 7th inst., $5,000 in gold, as the result of one week's run. The lode is opening better than ever.

The Colorado *Chieftain* gives the following: The telegraphic dispatches give accounts of a new mining excitement in the Taos Valley. These mountains along the Rito Seco and Arroyo Hondo, in that valley, have long been supposed to be rich in the precious metals. It has been said for many years that that district was a hundred or two hundred years ago occupied by Spanish miners, who accumulated immense sums of both silver and gold, and abandoned their mines during an Indian war, concealing as carefully as possible all traces of their operations. This new excitement will give an impetus to the explorations of prospectors, and from our knowledge of that country, we predict that rich and extensive discoveries of the precious metals will be made on the Rio Colorado, Arroyo Hondo and Rito Seco. Since Colorado was opened as a mining country, no systematic search for gold has been made in that country, and the indications have always been regarded by scientific men as being of rare promise.

OREGON.

Portland *Oregonian*, Jan. 16th: Frank Cooper, of Marion County, has in this city some specimens of iron ore which is thought to be of excellent quality, from a recently discovered mine in the region of Butto Creek. He proposes to send some of it to San Francisco by the next steamer, for examination and test by experts. He also has here some specimens of stone-coal and lime found in the same neighborhood. The latter is burned from a rock which seems to be mostly a conglomerate of sea shells. The ledge of rock is very deep and the supply inexhaustible. The lime makes an excellent cement, said to be quite as good as that made with Roman cement. Specimens of both the lime and the coal will be sent to San Francisco along with the iron ore.

From Cañon City we learn that mining operations are going on just as in summer time. There has been but little snow in the valleys, though the fall has been quite deep in the mountains. It is anticipated that the supply of water for spring and early summer operations will be good, and that the season will be a prosperous one. There is no local news of importance.

Wallace & Williams will have a 24-stamp quartz mill running in the John Day mines by early spring.

Dalles *Mountaineer*, Jan. 22d: A correspondent writing from Willows Creek, says: Few persons have any idea as to our enterprise. When completed our ditch will be over 100 miles long, and will command more mining ground, and give employment to more miners than there is at present in any mining camp in Oregon. It will require two years to finish the ditch, making seven years from the time the work was begun.

A Southern Oregon paper reports that the miners in Josephine County are all busy. Water is plenty, much rain having fallen there, and the streams are generally much swollen.

The Cañon City *Journal* says: Placer mining on Upper Cañon Creek is still in its infancy. Mr. J. Campbell has claims open and in fine working order, with an average yield per day to the hand of $17.

A Jacksonville paper learns that rich diggings have been struck on Picken's Creek, about eight miles from the Junction House, in Josephine County.

WYOMING.

Sweetwater *Mines*, Jan. 13th: Mr. Anthony shipped his 10-stamp mill recently for Sweetwater, by the lower route.

The South Pass correspondent writes: There is considerable stir in mining. Several rich discoveries have been made lately. At Miners' Delight matters wear a cheerful aspect. The company owning the western portion of the Miners' Delight lode struck very rich rock a few days ago. Some of the specimens which I saw were literally covered with the shining ore, and a piece of rock which was broken showed the free gold in abundance all through it. A sight of the specimens would have banished the doubts of the most skeptical in regard to the richness of our mines.

Walsh & Co's mill would be running now but for the delay of some necessary articles which were lost for a while on the railroad. They expect to be crushing in a week or two.

Sweetwater *Mines*, Jan. 20th: Among the newly-discovered lodes is one called the Nellie Morgan, about half a mile east of the town. There is now about 10 to 12 inches of good ore in sight. Some of the rock shows free gold, and all that has been prospected in a hand mortar yields richly.

Another new lode is the Minerva. A shaft has been sunk 12 feet, which shows a well-defined lead 12 inches wide. In a hand-mortar mill the rock prospects finely. In one prospect which I saw, fine particles of gold were to be seen, literally covering the bottom of the pan.

The Western Co., on the Miners' Delight lode, still continue to raise rich ore from their mine. Some of the specimens are magnificent, being almost entirely covered with the shining "ore." The company has now about 700 tons of ore ready for milling.

The Eastern Co., on the same lode, is now down between 40 and 50 feet, and has a finely-developed ledge of three feet in thickness.

Several new discoveries of lodes have been made in the vicinity of Rock Creek, some of which are said to be very rich.

'COMPRESSED AIR ENGINE.—A Cleveland mechanic claims to have invented an air machine that will give as much power, by increase of size, as can be had from a steam engine. He estimates the saving in fuel alone by his machine at $1,250,000 per year for the 1,000 or more steam engines in use in that city.

R. C. PAGE, (of H. F. Williams & Co.) has gone East to introduce the Stow Pavement there.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, Feb. 6, 1869.

Notices to Correspondents.

GUNPOWDER.—Artificially produced nitre is obtained by mingling together animal matters, ashes, and lime rubbish, in loosely aggregated heaps, and exposing such heaps to the atmosphere, but carefully protected from rain. When obtainable, the heaps are from time to time moistened with urine, and stable runnings; at appropriate intervals theso heaps are lixiviated, and the salt crystallized. Three years usually elapse before such nitre beds are worked; after which interval a cubic foot of the mixtnre is expected to yield between four and five ounces of nitre. It is found by the proprietors of the nitre plantations, that by the employment of the earth previously used for this purpose, it yields a fresh crop of nitre much more quickly than when fresh earth is used for the purpose.

SALIFEROUS.—The Wielitzka salt mine, which it has been recently stated is likely to be unworkable at an early day in consequence of an immense and apparently increasing influx of water, is in a bed which consists, as calculated, of a mass of rock-salt 500 miles in length, twenty miles broad, and 1,200 feet in thickness. Its geological positiou is in the cretaceous series, and it consequently belongs to the same geological era as the great mass of rock west of the Sierra, in California. The last fact is noteworthy as rendering it possible that similar saliferous deposits may some day be discovered in this State, though it is now well established that salt deposits may occur in all of the geological ages, down to the Silurian, the conditions being the existence of shallow or isolated basins.

L. S. M.—The electricity developed by friction in the ordinary electrical machine, as shown by Farraday, produces a corresponding amount of magnetic action on the needle of the galvanometer, and an equivalent amount of chemical decomposition. on electrolytes through which it is transmitted; and in the fusion of metallic wires we have evidence of its capability of producing heat of an intense character, while in the electric spark we have evidence of its power to produce light. The experiments of Farraday corroborated by those made by other scientists, have shown that the motion of a magnet of given strength, under certain conditions, produces, in a closed metallic conductor, a definite current of electricity, and through the electricity thus set in motion, light, heat, and chemical action may be developed.

A SUFFERER.—A lute for iron joints may be composed of a mixture of 60 parts of iron filings, sifted fine, and two of sal ammoniac, in fine powder, intimately blended, with one part of flowers of sulphur. The powder must afterwards be made into paste by means of water, and must be applied immediately; in a few minutes the lute so composed will become hot, will swell and evolve sulphuretcd hydrogen, and it speedily sets as hard as iron itself.

Freights to the Far Interior.

The importance of moderate freights for the development of the great interior having forced itself upon the attention of the Chamber of Commerce of this city, Mr. Chas. Crocker, the General Superintendent of the Central Pacific Railroad, has given notice, in a card to the business men of this State and of Nevada, that after July 1st a "material reduction" is to be made from the present rates on that road. These are now about double the rates charged on the eastern end, the Union Pacific Railroad; and the Denver and Central City people are complaining, nevertheless, of exorbitance even there.

Unless the managers of these grand railroad enterprises, in the interest of miners, prospectors and settlers in the interior, as well as of California and of the nation at large, are very stupidly blind, they will recognize the principle as an *axiom* in the matter of freight tariffs, that encouragement of the greatest amonnt of travel and freighting to which the circumstances of the country admit of being stimnlated, in local as well as in through business, will have the effect the more speedily to enhance the valne of their entire property, while nothing whatever is in danger of being lost in the matter of actual fare and freight even at a moderate advance only on the cost of transportation.

The foreseeing enterprise that could undertake and carry through such a piece of work as the building of the Pacific Railroad, will not fail to discover that the interests of a great through line, so advantageonsly situated—having an empire to develop, with untold wealth in the precious metals, the metallurgical conditions of which are involved in cheap freights—are all in favor of the lowest practicable rates.

Thus the question of fares and freights is likely to settle itself, and in a very natnral and qniet manner. If the railroad mauagers are wise, they will never permit the representatives of the peoplo to have any occasion to bring up the matter in Congress at all. An equally good reason for pursuing the most liberal courso is the probability that competitory roads, which, hereafter, are not to be favored with such extensive land grants, would not be called into existence by the demands for cheap freighting until after the destinies and the balance of trade and power in the land have become fixed and subservient to the interests of the first grand continental ronte.

OVERLAND MONTHLY.—The February number of this magazine contains articles of geographical and scientific value on Whirlwind Valley in Eastern Nevada; on the District of the Lakes, (referring to the salt lakes of the Great Basin); and on the Experiences of Eight Months in Sitka. The article on the Darien Ship Canal is by Mr. Bryan, an experienced canal engineer, who has been connected with various pnblic works, more espccially with the Baltimore and Ohio canal, and is an able review of the engineering questions involved in the different routes that have been proposed.

CENTRIFUGAL QUICKSILVER SEPARATOR.—At the Pioche electro-metallurgical works on Valencia street, corner of Seventeenth, there is in operation a little invention of Mr. A. Frick's, designed to separate the finely-diffused grains of quicksilver from the pulp which has been worked by the Nolf electric decomposition and amalgamation process. The pulp is fed through a funnel, on a horizontal revolving disc, like a plate or shallow bowl. By means of centrifugal force, the heavier qnicksilver particles are thrown violently against the walls of the tub, and there caused naturally to flow together, and to separate accordingly, from the lighter substances, by forming a stratum at the bottom of the tub.

History and Prospects of the Temescal Tin Mines.

It seems that as early as 1642, the people living at the Mission of San Gabriel became aware of the existence of a lode of singular reddish-brown metal at a place near the banks of the Temescal River, the Indian medicine men in the vicinity of the Mission having used it to eure the sick of their tribe; but the locality of the Pojalco, or Medicine Hill, was long concealed, until one of the tribe, being about to die, informed the white men at the Mission of the spot, and the latter going in search, found the hole from which the Indians had obtained the ore—but it yielded no silver. Not very long after the advent of Anglo Saxon hordes upon this coast, a wide awake one (whose name we regret we are not able to give in this connection) happened upon, and appreciated the trne valne of the deposit, and the result was that the lode, with a large tract of land around it was taken up; but the title was in dispute, and the claimants were unwilling to spend any money on the mine, until October, 1867, when the United States government finally issued a patent for a considerable tract of land, including the mine; but the large quantities of rain which fell last winter prevented any active operations, and they were not commenced by the company till the 24th of June, 1868. Since that time some 572 feet of drifts and 136 feet of shafts have been made. The main vein has been opened to the depth of 96 feet at the deepest point, and drifts have been run 300 feet.

The country rock is said to be granite without mica—or granulite. The drifts are all run in the foot wall, which is softer than the gangue. From twenty to fifty tons could be taken out daily from the mine in its present condition.

The company will sink 100 feet further and run a drift 100 feet long at that depth before they make any definite arrangements for reducing the ore; but the plan is not yet determined, further than they will crush and concentrate all the ore under 30 per cent., until it is 70 per cent. fine. This will cost, it is estimated, $3 per ton of crude ore.

Whether smelting will be undertaken at the spot, or the ore sent to England, seems to be yet undetermined. It is not an easy smelting ore, on account of its mixture with a large percentage of peroxide of iron; otherwise there would not be any question in regard to the matter. Skill in concentration, or a knowledge of the available metallurgical methods for getting rid of iron in such cases, should, it would seem, enable the company to avoid the necessity of shipping their ores. Wood in abundance can be procured at the distance of five miles from the mine. The distance to San Bernardino is fifty-five miles, and to Anaheim thirty-two miles, over an easy grade. The company employs about twenty-five men.

CHARACTER OF THE FEATHERSONE AND HIDDEN TREASURE MINES.—A valuable contribution to the mining geology of White Pine has just been made by E. B. Dorsey, M. E., in his report on the Featherstone mine, near Hamilton, White Pine, which contains important facts determining the nature of that and the Hidden Treasure deposits, with a diagram illustrating the former. The Hidden Treasnre and Featherstone mines are held to be trne contact veins, having a clay gouge between the vein matter and country rock,—facts showing conclusively that they are not mere infiltrations.

MYSTERY OF MOTION.—The lecture before the Young Men's Christian Association, on Tuesday last, by Rev. E. Corwin of Oakland, was a philosophical dissertation in which the speaker traced some common grounds between astronomy and the crystallizing force of atoms, as developed in the modern science of the correlation of forces.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

ANNUAL MEETING OF THE MECHANICS' INSTITUTE.—The Mechanics' Institute held its fourteenth annual meeting on Thursday evening, at the hall of the association on Post street—President Hallidie in the chair. The Treasurer submitted his annual report, from which we gather the following:

Total receipts during the year	$15,320 69
Total expenditures	15,094 23
Balance	$ 226 46

REPORT OF THE BUILDING COMMITTEE.

For rents, etc	$ 6,981 60
For repairs, etc	2,243 09
Receipts from members	1,110 00
Receipts from life members	700 00
Receipts from reading members	234 00

Books added to the library by purchase, 752 volumes; by presentation, 35. There have joined the association during the year 252 stock members; 109 reading members, and 14 life members.

The following committee was selected to make nominations for officers of the Institute for the ensuing year—the election to take place on the first Monday in March: H. K. Cummings, H. T. Blithe, Charles F. Bassett, Wm. McKibben, D. E. Hayes.

General Winn gave notice that he would at the next meeting submit a resolution authorizing the Board of Directors to issue stock to corporations whereby other bodies may be admitted as members of the Institute. It was also resolved to close the chess room, reading room and library every evening at ten o'clock, excepting on Saturday evening, when the hour of closing will be at half-past ten.

ARTIFICIAL STONE COMPANY.—Messrs. E. T. Steen & Co., who have formed themselves into a corporation under the title of the "Pacific Stone Company," and located their works at the corner of Turk and Larkin streets, are, we are pleased to learn, meeting with gratifying success, having already received orders for work as we are informed amounting to over $100,000. An earthquake-proof building material can be made by casting the stones with holes through them, for anchoring vertically or horizontally along the wall. Honse-fronts of this material are mainly in demand Pillars, or any other kind of article for nse or ornament, can be cast hollow, thus uniting the solidity, permanence and beauty of stone, with the lightness and cheapness almost of wood. Fence-posts, hollow and consequently light, are to be made by a centrifugal pipe-molding machine, if that can be made to work, as there is reason to believe it can. They could be made very cheaply in that manner, and provided with openings for rails, or wires, and an ornamental cap. Drain-pipes may also be found worth manufacturing. The materials used are common sand, as found everywhere, in quantities to satisfy; caustic soda, imported from England at a few cents a pound; and chloride of lime, also imported, at 2½ cents a pound, being the remnants of soda manufacture in Scotland, where a thousand carboys a day are thrown away. With caustic soda and qnartz they make silicate of soda on the ground, by boiling under pressnre. The works at the corner of Turk and Larkin streets are quite extensive and interesting, especially to the scientific visitor who can comprehend the chemistry of the process. A fuller description of them will be given hereafter.

VOLUME IV of the Proceedings of the California Academy of Sciences, contains valuable papers on the following subjects: Additions to the Fauna of California, by Dr. J. G. Cooper; Notes on Alaska, by T. A. Blake; on Botanical Gardens, by Prof. Bolander; Explorations in Alaska, by W. H. Dall; and on Earthquakes on Kern river in the central portion of the Sierra Nevada, by J. E. Clayton, M. E.

THE State Agricultural Society held its annual election on the 28th ult. Charles F. Reed was unanimously reëlected President; and in the evening the new Board of Directors elected Robert Beck Secretary, I. N. Hoag, the old Secretary, having declined reëlection.

Metallurgical Works.

In our notices of the chemical and metallurgical works in this city, we have left those depending upon simple pan amalgamation, to the last; being in only one case independent establishments—we refer to the place of G. W. Strong, on Stevenson street—generally located in a side room connected with one or another of the foundries, where pans of a partienlar construction are cast, and kept up mainly with a view to satisfying miners of the advantages of the same; or to afford facilities for trial and experiment to inventors who have new machinery, or now processes to deviso and carry out, which are dependent on the iron-workers' art before being brought to the attention of the public.

Mr. Strong's works aro in the basement at No. 10 Stevenson street, near First—in the vicinity of the foundries. To a visitor the place at this time presents a scene of unusual activity. A two-stamp mill, and a peculiar oscillating concentrator of Mr. Strong's invention, make noise enough to prevent idle conversation, and extra mortars and pestles, bateas and the like, are at work in the hands of assistants; while the assaying and roasting furnace stand in readiness to be used daily, or as occasion may demand. Ores of all kinds, for assay partly, but mainly for test workings on a larger scale, by such different processes as may be deemed worthy of a trial, are sent here from the gold as well as from the silver regions; the present jobs being mainly from White Pine, and containing some base or refractory ingredients.

Everything new, but more especially everything of established merit that has been developed in amalgamation, is the familiar and every-day subject matter of discussion and of trial at a place of this kind. In all that is known and proven to work to advantage in the amalgamation of gold and silver ores, Mr. Strong's works afford probably the best practical school on the coast, especially as Mr. Strong devotes himself to giving instruction in the different methods, as well as to working ores experimentally. Assaying having been his business for more than twenty years before coming to this country, the California and Nevada modifications of the several former amalgamation processes have fallen naturally to his hand; and his wide acquaintance with actual miners and mine owners, as far interior as the Rocky Mountains, furnishes the best evidence of his thoroughness in that specialty.

Two pans are at work here, the one most depended upon being the Union Pan, with a self adjusting muller.

The concentrator is a combination of the principle of the pointed box, best known in the form of the Rittenger box, or *spitzkasten*, with that of oscillation (not percussion), the operation being that of flooding away the lighter particles at the same time that a sharp oscillatory motion facilitates the settling of the heavier particles to the lowest point in the box. It possesses the advantage of never banking up at or near the point of discharge of the tailings. The ore may be made self-discharging, or not. A batch of 600 pounds of 8 per cent. tin from Temescal have just been washed by Mr. Strong, with satisfactory results.

Amalgamation rooms are connected with the foundries of Goddard & Co., Howland, Angell & Co., Palmer, Knox & Co., and at the Vulcan Foundry.

Mr. Varney's office, in connection with the Pacific Foundry, is, like the Works of Mr. Strong, devoted more especially to amalgamation processes, and also to the manufacture and sale of the Varney Pan.

Mining Laws of White Pine.—We are indebted to Mr. James Devlin, of Treasure City, for a copy of the mining laws of White Pine, which we publish on another page.

Rainfall of the Season.—The fall of rain during October, November, December and January, was as follows: In October, 15-hundredths of an inch; in November, 1 inch and 18-hundredths; in December, 4 inches and 34-hundredths; in January, 6 inches and 35-hundredths—making a total for the months named of 12 inches and 2 hundredths.

During the corresponding season in 1866-7, the amount of rain which fell was 21 inches and 5-hundredths, and in 1867-8 it was 23 inches and 84-hundredths; showing that we have had only a little more than half as much as in 1867-8, and that we shall require double the quantity henceforth to the end of the rainy season, in order to make up.

The Woodbridge *Messenger* says that a person who has been for many years a trapper and hunter in the extensive tule field west of Woodbridge, intimates that beaver have built higher houses than in any previous autumn—even that preceding the wet winter of 1861-2—and that such is the usage of these sagacious animals preceding wet winters.

The Rocky Mountain Parks.—The enterprising publishers of the Denver (Colorado) *Times* have issued an extra sheet with a well executed wood-cut map, representing the mountainous topography of one of the famous parks of the Rocky Mountains—the San Luis Park, containing Sawatch lake and the headwaters of the Rio Grande del Norte. A glance at the topography alone is sufficient to create at once a strong desire to visit those wonderful valleys that remind one so forcibly of Rasselas' happy valley, the monotony of his seclusion, his intense desire to get out into the great world for adventure, and of his futile attempts to do so by the narrow defile which afforded exit to the river of the valley. The system of Colorado parks and their geology and mineralogy, described in print on the back of the map, we find both interesting and valuable as reading matter, and worthy of laying aside for future reference.

The Legal Points at White Pine.—In the recent mining suit of the Eberhardt *vs.* the Richmond claims, at Austin, the jury came to the conclusion that there is a defined lode, and so ejected the Richmond parties as the latest locators. The significant point related of the workings was, that all within a belt of 200 feet, the limits of which are plainly visible, yield ore of more or less richness, while nothing is obtained from the holes dug on either side of that belt.

At Chloride Flat, it is supposed that there is a stratum of rich ore, say a hundred feet deep; then a bed of limestone or porphyry, fifty or a hundred and fifty feet thick, as the case may be; then another layer of ore, another of limestone, and so on. Jumpers contend that there is no difference in principle whether the veins lie horizontal, or stand vertical, or at an angle of forty-five degrees. The intervention of foreign rock, it is claimed, produces separate veins as much in one case as in the other.

Mining Reports Received.—We have received, and will notice more fully hereafter, the reports of the Arroyo Hondo Mining and Ditch Company of New Mexico (near Santa Fé), and of the Globe Gold and Silver Mining Company, of Alpine County, Cal., with maps, published in connection with "Some Facts about Gold and Silver Mines and Mining in California and Nevada."

The San Francisco Daily Herald.—This newspaper has taken its place amongst the journals of San Francisco, not as a new enterprise, but as an institution having already made its history, and quite as a matter of course. It is filled with an immense amount of ably prepared matter. The *personelle* of the office consists, evidently, of none but experienced newspaper men.

Turquois.—In the Columbus mining district (Nev.) beautiful specimens of genuine turquois have been lately discovered. A large and finely-tinted specimen will be presented to the King of Persia, by whom the mineral is highly esteemed. It is a bluish green, opaque phosphate of alumina and lime, with silica, iron, and copper, of the hardness of feldspar (6).

Our Office.

The office of the Mining and Scientific Press is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

DEWEY & CO.

No Branch Office.

Our friends and patrons will bear in mind that we have no branch office in San Francisco, our U. S. and Foreign Patent Agency rooms being suitably arranged with our Mining and Scientific Press printing office, at No. 414 Clay street. We have no partners in business except the undersigned. DEWEY & CO.

A. T. DEWEY. W. B. EWER.

Returned.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

---

O. M Taylor, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

A Short Engagement.—The person who visited Yuba, Sierra, and Plumas counties, last fall, as agent and correspondent of the Press, only continued a short time in that capacity.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco 6v18-3m

---

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

---

Where to Advertise.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local colums afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

---

ACROSTIC.

Pain Killer is *worth* what it weighs, in gold,
All around the world are its praises told;
It will Cholera cure—scourge of southern climes,
No victim dies, who takes it betimes.

Keep Pain Killer—a true friend by your side,
It will cure Cough or Cold, or Colic by-side;
Look out to apply it for Bruise or for Sprain,
Let it once be tried—"*twill be used again*;
Every word I am telling you, Reader, is true;
Remember that Pain Killer *is great for you*.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.
REMINGTON & CO., and HOSTETTER & SMITH, San Francisco Cal., General Wholesale Agents. febtim

---

PAIN KILLER.

No article ever attained to such unbounded popularity.—*Salem Observer.*

An article of great merit and virtue.—*Cin. Nonpareil.*

We can bear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch.*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Tenn. Organ.*

It has real merit; as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*

It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.* 26v17-1m

MOSHEIMER'S
PIONEER MINING SCHOOL,
—AND—
METALLURGIC WORKS.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to assay and work any kind of ore, or mineral substances.

For terms, apply to **JOS. MOSHEIMER,**
Practical Chemist and Metallurgist.

Office, 323 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 6v18-6m

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this marvelled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 11, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London. 6v18-1y

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Mining and Scientific Press.

Orders from the interior faithfully attended to.

THE NEW CABLE.—The core of the French Atlantic cable which is to be laid in June next, consists of seven copper wires, the center one of which is coated with a film of adhesive matter known as "Chatterton's compound." It is made in lengths of one mile, and wound on iron reels, whence it passes through a die to determine the size;—plastic gutta percha being at the same time forced down upon it by screw pressure. Four successive coatings are put on in this manner; and between every two the conductor receives a coat of the above named adhesive compound. It then undergoes immersion for twenty-four hours in water of 75° Fah., at the expiration of which it is subjected to the most delicate test that electricians can devise. The coils, after being tested and passed, are joined two together, and wound on drums, to be conveyed to the sheathing works, all joints between the coils having also been put under a rigid electrical test. Jute yarn is then wound round the core, after which ten wires of homogeneous iron, each of which is covered with Manila yarn, steeped in tar, are added, and the cable is complete. The total weight of the core is 800 pounds per nautical mile, the copper being 400 and the gutta percha 400. The total length of cable for the section from Brest to St. Pierre is 2,788 nautical miles. The second section, from St. Pierre to New York, will be a smaller wire, consisting of a conductor of 107 pounds per nautical mile, and the insulator 150 pounds, the length being 776 nautical miles.

THE STANDARD YARD.—The standard of linear measure adopted by the State of New York, is determined from a pendulum which vibrates seconds in a vacuum at Columbia College, which is in the latitude 40° 42′ 43″. The yard is declared to be 1,000,000-1,087,141 of this pendulum, hence, the length of the pendulum is 39.101688 inches at the temperature of 32°. Should the standard yard be lost, it could be recovered by experimenting in accordance with these conditions.

The Imperial standard yard of Great Britain is determined from a pendulum which vibrates seconds, in a vacuum at the level of the sea, in Greenwich or London. This pendulum is divided into 391,393 equal parts, and 360,000 of these parts are declared by Act of Parliament to be the standard yard, at the temperature of 62 degrees; consequently, since the yard is divided into 36 inches it follows that the length of a pendulum vibrating seconds under these circumstances is 39.1393 inches.

PROFITS OF EUROPEAN PATENTS.—Our London correspondent remarks in a recent letter, that the American origin of an invention is now a recommendation in Europe, where many of these inventions are in successful operation and large fortunes have been realized by their introduction. Improvements relating to some manufactures are of great value in this kingdom. Mr. Bessemer derives an annual income of about $2,000,000 from his British steel patents, and the patentee of a device for driving millstones by a revolving diamond, has realized over $1,000,000 the first year of his patent. The use of a diamond for this purpose is an American invention, and the estimated value of the exclusive right in England, for ten years, is $5,000,000. British patents, as a rule, are the most valuable, but many inventions are equally profitable in other parts of Europe, and some are peculiarly adapted to continental wants and customs.

THE GOVERNMENT LABORATORIES.—The French Government is at present engaged in the construction of a magnificent suite of laboratories in Paris, for the pursuit experimentally of the higher physics and chemistry, as well as their application. This has no doubt been urged on by the like move made three years ago, by the Prussian Government, in the vast laboratories established at Berlin and at Bonn. In both countries, knowledge, pure science, is promoted and reverenced. In Great Britain such a thing as a "national *physical* laboratory does not exist; nor indeed in a strict sense do we possess a national school, much less laboratory, of chemistry. Yet ours is the country that declares it intends to keep in the van of all science."—*Coll. Guardian.*

MORE GOLD IN CANADA.—The Wolfville (Canada) *Acadian* says there is quite an excitement in reference to gold diggings on the Gasperaux Mountain, directly south of Wolfville. Mr. Nathan Harris has been offered $1,000 for his claims.

How to make Good Bread.—If any body ought to know all about the matter named in our heading, it is a miner. Yet there are pleaty of hard-fisted fellows in the interior whose "bread" ever since '49,—although eaten with impunity,—has been so eaten only because their hardy old guttapercha stomachs were dough-proof. For the benefit of such, we give the following direction for the makiug of this most important article of daily food, from a leetnre recently delivered by Prof. Horsford, of Cambridge, Mass., who has made a specialty of chemistry as applied to domestic uses:

"Select good, plump, fully ripened, hard-grained wheat. Have it freshly grouud, and not too finely bolted. Prepare the yeast as follows: Boil thoroughly with the skins on, in one quart of water, enough potatoes to make a qnart of mashed potatoes. Peel the boiled potatoes and mash them to fineness; mix intimately with them one pint of flour, and stir the whole to an emulsion with the water in which the potatoes were boiled. Cool the product to 80° (lukewarmuess), and add half a pint of the best baker's yeast, and a tablespooaful of brown sugar. Set aside the mixture at an even temperature of about 80° till it works well, or is in aetive fermeatation. Of this yeast take half a pint to a gallon (seven pounds) of flour, mixed with threo pints of water, or two of water and one of milk, all at the temperature of about 80°, add a little salt, knead thoroughly, and set aside to rise at the temperature mentioned. When it has risen to nearly the full volume for the dough, divido it into loaves, knead again, set it aside at the temperature already named till it attains the full size of the loaf, and place in an oven heated to not less than 450°. Let the loaves of dough be smaller than the tins. Keep them covered with a flat tin plate or stiff paper till the dough is fully raised and the heat carried up to and sometimes maintained throughout tho loaf at 212°, to convert all the stareh to the mucilagiaous or emulsion form aad destroy the ferment. Then remove the cover, and permit the browniug to take place. If tho loaves are large, a higher temperature will be required. Seven pounds of fine flour will make eight loaves of 1¼ pounds each when baked, or four of 2½ pounds each. Such yeast will keep a week in winter, and from two to four days in summer. Bread made with it, in faithful obedience to these instructions, will be good."

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only
GOOD SAUCE.
The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for
Lea & Perrins' Sauce,
and see that their names are upon the wrapper, labels, stopper, and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, Lea and Perrins give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their rights may be infringed.
Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.
Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-1y

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N.Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to
H. H. T. NESTELL, A. M., M. D.,
Lung Institute,
No. 516 Sutter Street, San Francisco,

Altitudes in California.

COMPILED FOR THE MINING AND SCIENTIFIC PRESS, BY C. D. VOY.

The following altitudes above the sea, of important points in California, are on the authority of the State Geological Survey. California is 700 miles long, 200 broad, contains 158,687 square miles, and a population estimated (1868) at 500,000:

Altitude of	*Feet.*
Yreka, Siskiyou co	2,700
Surprise Valley, Siskiyou co	4,680
Mt. Shasta, Siskiyou co	14,440
Mt. Balley, Trinity co	6,357
Mt. Yellow Valley, Trinity co	8,000
Lassen Peak, Shasta co	10,571
Black Butte, Shasta co	9,500
Nolles' Pass, Lassen co	6,074
Quincy, Plumas co	3,127
Pilot Peak, Plumas co	7,605
Beckworth Pass, Plumas co	4,500
Downieville Buttes, Sierrra co	8,800
Clear Lake, Lake co. This beautiful sheet of water is from 2 to 12 miles wide, and 30 miles long.	
Geyser Peak, Sonoma co	3,471
Mt. St. Helena, Sonoma co	4,343
Sacramento, Sacramento co	54
Auburn, Placer co	1,385
Colfax, Placer co	2,448
Dutch Flat, Placer co	3,425
Summit of Sierra	7,042
*Lake Tahoe, boundary of California and Nevada	6,250
Mt. Tamelpais, Marin co	2,600
Mt. Diablo, Contra Costa co	3,876
Mt. Oso, San Joaquin co	3,383
Big Tree Grove, Calaveras co	4,750
Silver Mountain, Alpine co	10,934
Livermore Pass, Alameda co	6,800
Mt. Hamilton, Santa Clara co	4,449
Mt. Bache, Santa Clara co	3,780
Pacheco Peak, Merced co	2,845
Dome Mountain, Mariposa co	8,797
Mt. Hoffman, Mariposa co	10,872
Cathedral Peak, Mariposa co	11,000
Mt. Dana, Mariposa co	13,227
Mono Pass, Mariposa co	10,765
San Carlos Peak, Fresno co	4,977
Bald Mountain, Fresno co	7,936
Mt. Silliman, Fresno co	11,623
Castle Peak, Mono co	13,000
Mt. Braly, Mono co	9,435
†Mono Lake, Mono co	6,454
Mt. Lyell, Mono co	13,217
Dome Mountain, Tulare co	9,825
Mt. Tyndall, Tulare co	14,366
Kaweah Peak, Tulare co	14,000
Mt. Whitney, Tulare co	15,000
Mt. Brewer, Inyo co	13,000
Walker Pass, Kern co	5,300
Tehatchapyah Pass, Keru co	4,020
Tejon Pass, Los Angeles co	4,250
Mt. Pinos, Los Angeles co	7,500
San Francisquito Pass, Los Angeles co	3,437
Mt. Parkinson, Los Angeles co	6,000
Soledad Pass, Los Angeles co	3,164
Cajon Pass, San Bernardino co	4,600
Mt. San Bernardino, San Bernardino co	8,500
San Gorgonia Pass, San Bernardino co	2,800
Warner's Pass, San Diego co	3,780

*This beautiful lake is about 12 miles wide and 21 miles long. It is engulphed between two ridges of mountains, which form on either side some of the highest peaks of the Sierra. The central portion of this lake has been sounded to 1,400 feet.

†This very remarkable alkali lake is sometimes called the Dead Sea of America. It lies 10 miles southwest of the dividing line between California and Nevada, and is about 14 miles long and 9 miles wide. It has never been sounded, but a trial said to have been made with a line of 300 feet failed to reach bottom. By chemical analysis a gallon of the water weighing 8 pounds, was found to contain 1,200 grains of solid matter, consisting principally of chloride of sodium, carbonate of lead, sulphate of soda, borax and silica. The bitter and fatal waters of this lake render it literally a "dead sea," and all its surroundings—wild, gloomy and foreboding—are suggestive of sterility and death. Very large numbers of mineral curiosities abound in the neighborhood of this lake.

TURBINES.—*Eds. Press:*—We notice in your issue of January 16th, an article on "Turbine Water Wheels," stating that the "Jonval, Lind and Tyler turbines (French, California, and New England inventions, respectively) furnish the highest percentage of absolute power in the order named, and are cheap, in proportion to the power furnished, in the reverse order." This statement is correct in the main and most important particular as to the percentage of power, on which point we would call attention to an article in the *Scientific American* of December 23d, entitled, "The Jonval *vs.* the Fourneyron Water Wheel." In reference to the cheapness of the respective wheels, we beg to correct your statement, as the facts are just the opposite—the Jonval wheel being from fifty to one hundred per cent. cheaper than either of the other wheels mentioned. Very respectfully, FULLER & Co.

San Francisco, Feb. 4, 1869.

HISTORY OF GOLD IN NEW ZEALAND.—The islands have produced £11,000,000 of gold a year during three years since the mines were discovered. In 1864, and for years previous, it will be recollected by all who then read the New Zealand papers, there were premiums offered by government, and higher premiums advocated by newspaper correspondents, for the discovery and development of gold mines in that country; a conviction prevailing that gold could be found there in quantities to pay.

Engineering.

RAILROAD BUILDING.—The Central Pacific Railroad Company are surveying a branch line from Ogden City to the southward, through Salt Lake Valley, touching the city of the Saints, Kaysville, Farmington, Centerville, Bountiful, etc. The rumor is revived of the intention of the Union Pacific Company to continue their road into California by the Beckwourth Pass route, in connection with the Oroville and Virginia City Company. The contract has been let for the first section of the California Pacific extension from Davisville to Marysville, and the whole road to the latter point is expected to be finished by August.

The *Bulletin* says: The completion of the the beginning during the present year of Pacific Railroad will liberate considerable labor and capital for the prosecution of local roads in this State, and we may look to see such an era of railroad building as populated and enriched Illinois in the decade following 1850.

THE ENGINEERING DATA OF THE OROVILLE AND VIRGINIA CITY R. R. are as follows:

Distances—Vallejo to Oroville, estimated, 107 miles; Oroville to State line, actual measurement, 134; State line to Lander City at the Big Bend of Humboldt, estimated, 108. Total, 349 miles.

Gradients—Maximum per mile, 66 7-12 feet; average 34 feet.

Elevation—Greatest at Beckwourth's Pass, 4,682 feet.

Estimated Cost of Constructing—The Oroville and Virginia section of this road—made by competent engineers and from actual surveys—from Oroville to Quincy, 77¾ miles, $37,500 per mile. Total $2,915,625.

From Quincy to State line, 56¼ miles at $20,000 per mile, $1,125,000. Total $4,040,625.

Superstructures—Track complete, including 10 miles for turnouts, 144 miles, $1,400,000.

Rolling Stock to Work it—As part of the main Pacific Road, $1,000,000; buildings, shops and fixtures, $400,000. Grand total, $6,840,625.

TELEGRAPH BUILDING IN MEXICO.—The telegraphic wires are now up for the whole length from Manzanillo to Vera Cruz, *via* Colima; Guadalajara and the capital. The other lines to Morelia, Acapulco and the Rio Grande, will be finished before the rainy season sets in.

From Guaymas we hear that the State Government is actively engaged in establishing a telegraph line from said port to the Capital Ures, and that a company is forming there to carry the work out and avail itself of other franchises which the State Legislature has granted.

PROPOSAL TO DREDGE THE SACRAMENTO RIVER.—The *Union* says the Sacramento river is fast filling up with the sand which has been set loose by miners in the mountains, and is brought down by the currents in winter, rendering the river difficult of navigation. It is known that the present bed of the river is many feet higher now than it was 10 or 12 years ago, and this debris is gradually filling up Suisun and the other bays. The evil can only be remedied in one way—says the *Union*—and that is by dredging the river from the debouchment of its two chief affluents—the Feather and Americau—to Suisun Bay.

WATER AT WHITE PINE.—The want of a supply of water will be a great drawback at White Pine in the spring. Although the range of mountains running down to and below Hamilton is full of water, no companies are pushing the work of tunneling. It is thought that water in such supply as must flow when a tunnel reaches a point under these springs would produce a large revenue.

BLASTING OUT THE CORAL REEFS OF MIDWAY ISLAND.—The Senate has added $50,000 to the Naval Appropriation Bill to improve the harbor of Midway Island, which has been surveyed under the direction of Admiral Thatcher, and is to be made a safe refuge for our commerce in the North Pacific. The island belougs to the United States, and is half-way between China and California.

WATER SUPPLY AT VALLEJO.—Three different companies have been organized to furnish Vallejo with fresh water, yet neither has made a move in the matter yet.

White Pine Items.

MINING STOCK OPERATIONS.—A White Pine correspondent of the *Alta* says: Large sales of mining ground continue to be made, and I think the figures *here* are reasonable; but a word of caution to your good people, who cannot come and see for themselves. Every new mining camp is filled with irresponsible men, who get hold of some mines—perhaps very good ones—and put any price upon them that they can, but at a very heavy advance from "first hands." They *bond* mines and take them to your city. No parties here will bond a mine at anything like the cash price; but they are talked into it, and you pay for such useless service. I say useless, because most of the purchasers have friends here, and should certainly take some advice before action. Quite a number of mines have been taken to your city in this way during the past week. Many of your capitalists contribute a few thousand dollars to some agent or representative for the purpose of buying property, and the said representative is a big toad in the puddle while the money lasts. The character of our ores, and the fact that few are at all acquainted with them, have given inexperienced men a good opportunity to compete with those long in the business.

DEPTH OF THE WHITE PINE DEPOSITS.—News has been received from Hamilton that ore has been struck in a tunnel 100 feet below the surface in the Virginia mine, situated on the northern flank of Treasure Hill. The importance of this fact consists in its showing that the mines in that district are probably not merely superficial deposits liable soon to be exhausted.

PORTABLE STEAM POWER.—A portable steam engine on wheels has gone up on the Sacramento boat, *en route* for White Pine, to be used as the motive power for a crushing mill on a small scale.

POPULATION OF WHITE PINE DISTRICT.—A gentleman recently from White Pine estimates the population of that district at 6,000. The population of Treasure City alone is believed to be not less than 3,500.

A COMPANY of sixteen citizens of Gibsonville, Sierra County, have incorporated, and will send Robert Walsh to the White Pine country to prospect.

TELEGRAPH TO WHITE PINE.—Mr. James Gamble, Superintendent of the Western Union Telegraph Co., informs the *Bulletin* that a contract has been let for the telegraph poles for a line from Ruby Valley to White Pine; that the wire is now on the way, and that the line will be in operation in six weeks.

Resources and Developments.

VALLEJO has a population of 5,000.

SAN LEANDRO has four gang-plow manufactories.

A TREE on the ranch of G. N. Sweezy, Yuba County, bore a crop of 100 oranges last year.

THE Stockton *Independent* thinks that California teazle (a kind of burr) is good for carding wool and cotton.

THE citizens of Millville, Tehama County, are actively engaged in organizing and establishing a woolen factory.

SILK GROWING.—I. N. Hoag has shipped four large wool sacks of silk cocoons, weighing 113 pounds, to R. & J. Morton, of San Francisco. The cocoons were those perforated by the moths in their exit, and are used for the manufacture of velvet and mixed goods, and were sold at seventy-five cents a pound.

CONCENTRATION AND SMELTING OF TIN ORES.—A bar of eighty-five pounds of tin, of .97 fineness, from the Temescal ore, has been turned out from Mosheimer's Smelting Works, the work being done in small crucibles. The intention is to crush the ore to such a fineness as to pass through a screen of from 18,000 to 20,000 meshes to the square inch; as it is found that in order to render the reduction of tin ores effectual, they must be crushed to an extreme fineness. After being concentrated at the Union Foundry, the ores are to be smelted at Mosheimer's Smelting Works, for the present.

CHERRIES RIPENED OUTDOORS IN JANUARY.—A city cotemporary mentions the plucking of a fine cluster of ripe cherries, a day or two ago, from a tree in the garden of Otis V. Sawyer, on Hyde street. Volumes in favor of the mildness of the climate of California could not speak more.

HENRY CAREY BAIRD,

Industrial Publisher,

No. 406 Walnut Street, Philadelphia.

HAS RECENTLY PUBLISHED

A Practical Guide for the Perfumer; Being a New Treatise on Perfumery the most favorable to the Beauty without being injurious to the Health, comprising a description of the substances used in Perfumery, the Formulæ of more than one thousand Preparations, such as Cosmetics Perfumed Oils, Tooth Powders, Waters, Extracts, Tinctures, Infusions, Spirits, Vinaigres, Essential Oils, Pastels, Creams, Soaps, and many new Hygienic Products not hitherto described. Edited from Notes and Documents of Messrs. Debay, Lunel, etc., with additions by Professor H. Bussance, Chemist. 12mo. $3 00

Cabinet Maker's Album of Furniture: Comprising a Collection of Designs for the Newest and Most Elegant Styles of Furniture. Illustrated by 48 large and beautifully engraved plates. In one volume, oblong 5 00

The plates of this beautiful volume comprise designs for bedsteads in great variety: chests of drawers; wardrobes; dressing bureaus; tables for the chamber; work-tables; extension dining tables; card and chess tables; parlor tables, Louis XV. and other styles; office tables; chiffoniers; ladies' and other secretaries of different forms and styles; toilet tables and glasses; desks; book-cases; sideboards, etc., etc.

Gothic Album for Cabinet Makers: Comprising a Collection of Designs for Gothic Furniture. Illustrated by 23 large and beautifully engraved plates. Oblong $3 00

The plates in this volume comprise designs for sofas, arm and other chairs, stools, taborets, prie-dieu, tables, chests of drawers, wardrobes, chimney-pieces, side-boards, pier tables, etageres, desks, book-cases, etc.

A Practical Guide for Puddling Iron and Steel.—By Ed. Urbin, Engr. of Arts and Manuf. A Prize Essay read before the Association of Engrs. Graduates of the School of Mines, of Liege, Belgium, 1865-6. To which is added a Comparison of the Resisting Properties of Iron and Steel, by A. Brull. From the French, by A. A. Fesquet, Chemist and Engineer. 8vo., cloth $1 00

☞The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is just ready, and will be sent free of postage to any one who will favor me with his address. 20v16tf

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR FEBRUARY, 1869.

The following Steamships will be dispatched on dates as given below:

February 6th—GOLDEN AGE.....Capt. E. S. Farnsworth, Connecting with ALASKA, Capt. Cray.

February 13th—COLORADO.....Capt. Wm. H. Parker, Connecting with RISING STAR, Capt. King.

February 22—SACRAMENTO.....Capt. ——— West, Connecting with HENRY CHAUNCEY, Capt. Connor.

February 27th—MONTANA..... ....Capt Wm. H Hudson: Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—400 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship JAPAN, Captain George E. Lane, will be dispatched on THURSDAY, February 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Patent Brokerage.

PATENT RIGHTS

Bought and Sold on Commission.

A variety of new and valuable Patents for sale, novel and useful articles, suitable for TRAVELING AGENTS, always on hand, among which are the following:

Patent Cigarette Roller, and patent gummed Wrappers for the same. Every one can make their own Cigarettes. Price $2.50 (including 400 wrappers.)

Wilson's Patent Solder, for mending tin ware without soldering iron, prepared for family use. Retail price 50 cents.

Elliptic Steel Scrapers, for cleaning boiler tubes (all sizes)—best thing ever invented for the purpose. Retail prices from $8 to $10.

AGENTS WANTED.

Address "E. M. D." P st Office box 17, San Francisco. 2-v17tf

DEWEY & CO.,

American and Foreign Patent Agents,

Publishers and Proprietors of the MINING AND SCIENTIFIC PRESS, the only well established successful Patent Agents on the Pacific Coast, will give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

DEWEY & CO.,

Patent Agents, Publishers and Printers, 414 Clay street below Sansome, San Francisco.

A. T. DEWEY. W. B. EWER.

Read and Sub cribe.

With the advantages of past experience, the increased patronage and friendly support of the intelligent and progressive readers of the Pacific States and Territories, we are confident in asserting that the new volume of the MINING AND SCIENTIFIC PRESS, commencing with 1869, shall be in all respects superior to its predecessors. Of the past, we will give the written

OPINION OF OTHERS:

EVERY miner in the community should subscribe for the Mining and Scientific Press.—*Grass Valley Union.*

MINING AND SCIENTIFIC PRESS.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec. 19.*

THE MINING AND SCIENTIFIC PRESS has become almost indispensable to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 10th.*

THE *Mining and Scientific Press* is one of the best papers of the kind ever published, and to California miners, especially, it has become an almost indispensable requisite for the successful prosecution of their calling.—*Nevada Gazette.*

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th*

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reductiou of ores, new machinery, etc.—*Grass Valley National.*

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books. *Nevada Gazette.*

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every minor, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

MINING AND SCIENTIFIC PRESS.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, but more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

A USEFUL PUBLICATION.—The MINING AND SCIENTIFIC PRESS, published at San Francisco by Dewey & Co., is a publication valuable to all classes and indispensable to miners and inventors—the pateuts for nearly all California inveutions having been secured through the Patent Agency of the proprietors of that paper, and the inventions themselves brought into notice through its columns. We are glad to learn, from Mr. Wm. H. Murray, the traveling agent of the paper, who dropped in upon us Monday evening, that its merits are so well appreciated; and we unhesitatingly commend both the paper and its gentlemanly agent to the confidence and patronage of scientific and practical men of all classes and every occupation.—*Solano Herald.*

THE MINING AND SCIENTIFIC PRESS, of this city, has done us the honor to notice us in their columns, and we feel in duty bound to acknowledge the compliment.

It were fruitless for us to say anything in praise of the MINING AND SCIENTIFIC PRESS. * * * It speaks for itself wherever it goes. Its editors are men of intelligence, ability and honor.

We have had frequeut occasion to have business relations with the pateut agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

SUBSCRIPTION TERMS, in advanee, $5; six months, $3. Specimen Nos. of the paper and Circulars of Information for Inventors, sent free on application.

DEWEY & CO.,
Publishers, Patent Agents and Job Printers, No. 414 Clay st., below Sansome, San Francisco.

A. T. DEWEY. W. B. EWER.

SULPHURETS;

What they are;
How Assayed;
How Concentrated;
And How Worked;

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

GRASS VALLEY, Dec. 2, 1868—*Messrs. Dewey & Co:*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, SYMONS & HARNY.

THE CELEBRATED

IMITATION GOLD

$15. Hunting Watches. $20

CASES OF THE
COLLINS METAL
(IMPROVED OROIDE)

Special Notice.—Our superior Oroide Watches having recently been imitated, and worthless watches sold in New York, Boston, Chicago, and other cities, represented as our watches, we hereby caution the public against them, and give notice that we are in no way responsible for these bogus concerns, and only those purchasing directly from us can secure a genuine Watch of our manufacture. We have recently greatly improved our Oroide in appearance and durability, and, to protect the public from imposition hereafter, have named it the "COLLINS METAL," and we give notic that any one making use of this name will be prosecuted to the extent of the law.

This metal has all the brilliancy and durability of gold; cannot be distinguished from it by the best judges; retains its color till worn out, and is equal to gold excepting in intrinsic value. All our Gentlemen's Watches are *Full Jeweled Patent Levers*; those for Ladies an improved Escapement, better than a lever tor a small Watch; all in Hunting Cases, and fully guaranteed by special certificate. The $15 Watches are equal in neatness, style of finish, general appearance, and for time, to a gold one costing $150. Those for $20 are of *extra* fine finish, and are fully equal to a Gold Watch costing $200. Chains of every style, from $2 to $6. A so, Jewelry of the Collins Metal in every style.

To Clubs, where six Watches are ordered at one time, we send ONE EXTRA free of charge. All our prices are in Currency.

Goods sent to any part o the United States by express, to be paid for on delivery. Money need not be sent with the order, as bills can be paid when goods are taken from the express office. Customers must pay all express charges. We employ no agents; orders must therefore be sent directly to us. Customers in the city will remember that our *only Office* is

Nos. 37 and 39 Nassau street, New York,

Opposite the Post Office, (up stairs.)

C. E. COLLINS & CO.

Citizens of Toronto and the Dominion generally, take notice. We have hundreds of testimonials. But you need no further evidence than the following from one who is well known among you. Here is his proof positive.

Harry Hazleton, the well known author, says:

"I have always looked upon cheap watches as humbugs, and dealers in them as little better than swindlers. At the request of a friend, I have worn for three months, the watch he purchased of C. E. Collins, and for which he paid $15. It accurate time, retains its perfect golden appearance, and I can really see no difference between it and my own, which cost five times the amount of the Collins Watch."

Mr. Hazelton adds:

"I have since purchased FIVE of these watches, at the request of friends and those for whom they were intended are perfectly satisfied. Others are seeking for them, and I fancy that Mr. C. will find some difficulty in supplying the constantly increasing demand."

☞The regular price of the watch is $15, and others costing $20. These are superbly finished, and really superior to any article placed upon the market, costing five times that sum.

Office Stato Capital Reporter, 42 and 44 J street, Sacramento, Cal., July 15, 1868:

C. E COLLINS & CO.—Gentlemen:—Wells, Fargo & Co. delivered Watch and Chain, as per order, paid bul on presentation. The Watch and Chain give entire satisfaction, and several of my friends wish the same quality of watch and chain. One is chief editor of this paper, and two others are the publishers of this paper, and the others are for friends of mine, and by wearing your goods will make you a large sale in this city. I therefore wish you to send me seven watches and seven chains, of same quality as those you sent me, price paid you $15 for watch, and $6 currency for chain. I return you the guarantee, it may assist you in ascertaining the exact kind of goods sent me, the number of the watch sent is 66,982. If this order sent turns out as satisfactory as the first, we will give you a good editorial notice, and help you along as far as practicable. I send this order not for my benefit, but for yours and to accommodate my friends. Send to E. K. Phipps, office of "State Capital Reporter, Sacramento, California."

Yours, respectfully,

E. K. PHIPPS.

Address,

C. E. COLLINS & CO.,

37 and 39 Nassau street, New York.

IMPROVED INNER SOLES

—FOR—

BOOTS AND SHOES.

Those who have worn Daggett's Patent Elastic Ventilating Inner Soles, are unanimous in testimony that the correct principle has been hit upon and reduced to practical and successful use. The foot rests upon a cushion of air cells between points of vulcanized rubber, every cell opening freely into each other and through the space occupied by the foot. There is no contact of the foot with the wet bottom of the boot. The elastic points sustain the weight of the wearer, leaving an air space always, between the foot and all dampness. Every step compresses and restores the air chambers, thus constituting hundreds of air pumps, working at every step of the foot.

The rubber points will not absorb the moisture from the boot, so that the soft flannel which covers them is always dry. Their springing elasticity renders them of peculiar value to the aged and infirm, who feel the jar of walking upon hard substances, also to all persons whose business requires much walking or standing.

These soles are affording great relief lo persons afflicted with rhumatism and consumptive complaints, chilblains, corns, cold and sweaty feet.

For warm and dry feet use the Patent Elastic Ventilating Inner Soles.

No. 15 Exchange Street, Boston, Oct. 15, 1867:—This may certify that I have used the Patent Elastic Ventilating Inner Soles, through the spring and summer past, and have found them to be the best contrivance for keeping the feet dry and comfortable, that I have ever used, and for any one having corns or tender feet, the best article ever invented. CHARLES K. DARLING, Stationer.

Patent Elastic Ventilating Soles—If you wish a comfortable article for your feet, a real luxury in cold weather, obtain a pair of the Patent Elastic Ventilating Inner Soles. Having used these soles the past winter, we can safely recommend them as tending not only to promote the comfort of the feet, and ease in walking, but also the equalization of the temperature of the feet, which renders them almost invaluable.—[Boston Traveler, Oct. 1867.

Price, per pair, $1. By mail, postage paid, $1.25. For sale by PATRICK KELLY, No. 327 Bush street, San Francisco. 3v16tf

Mining Notices.

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of January, 1869, an assessment of two dollars ($2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary at the office of the Company, No. 327 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1869, shall be delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. jan16

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of January, 1869, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of February, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventeenth day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNINSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. jan30

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of January, 1869, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 426 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth (5th) day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirtieth (30th) day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

R. N VAN BRUNT, Secretary.

Office 426 Montgomery street, San Francisco. jan30

North American Wood Preserving Company.
Location of Works: San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the fifteenth day of January, 1869, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the Company's office, 419 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of February, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

jan9 ENOS TAYLOR, Secretary.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**
1v1 San Francisco.

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Splers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. P. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

What Blacksmiths Want.

WATSONVILLE, Santa Cruz County, Cal., Jan. 20th, 1869. *Editors Press:*—We want a traveling bellows-maker to come around once a year and repair our bellows. We often have bellows that want fixing and filled with new leather; and to freight the bellows to and from the city, and have them repaired, would not pay, and would cost as much as a new one. We also want a good man to put our stocks and dies in order, or we want duplicates of those we buy. I think if some good mechanic would come along with a small hand planer to put in a vise, and would travel around putting our screw-plates in order, and sharpening saws, etc., he would do well, find plenty to do in each town, and at the same time oblige the blacksmiths in this part of the country. A BLACKSMITH.

NEW IRON SHIPS.—A correspondent of the Loudon *Evening Post* says: "It seems that about half the iron ships lost are lost in their first voyage; chiefly owing to the imperfect adjustment of compasses. The iron of the vessel is counteracted, in its influence on the needle, by strong masses of magnetic iron placed about the compass boxes. But the adjustment of these, in amount, strength, distance from the needle, and direction, is delicate and difficult. A lake near Greenock, is used for adjusting the compasses for the Clyde vessels. They are slowly moved through the various inclinations to the meridian, the variation at each point noted, and the magnets contrived, by a complicated calculation, to counterbalance it. But the variation itself differs with each change of the ships' position, relatively to the horizon, as well as to the meridian. These differences are measured by an ingenious contrivance known as the 'inclinometer,' and corrected by rules empirically deduced from a multitude of observations under all varying circumstances. The record of observations is still kept up on the ships, with a view to perfecting these rules. An old East India captain lately lost a fine new iron steamer on her first voyage, only eight hours out of Glasgow, by utter inability to tell which way was north, his compass being entirely capricious."

STATISTICS OF FLOUR, SAW, SHINGLE, QUARTZ AND WOOLEN MILLS.—There are now in California, as shown by the reports of the County Assessors, 62 steam grist mills, with 205 run of stone, and 67 water, with 116 run of stone, all of which turned out 1,400,413 barrels of flour, and ground 166,780 bushels of corn during the year.

Sawmills: 207 steam-power, and 161 water-power, which produced 220,991,213 feet of lumber, 108,007,000 shingles were made.

There are 360 quartz mills, which crushed 391,480 tons of rock. Water ditches, for mining purposes, with an aggregate length of 11,949¼ miles, and using 711,936 inches of water per day. Water ditches, for irrigating purposes, 720, irrigating 70,588 acres of land.

Woolen mills, six, which used up 3,125,000 pounds of wool—about half the product of the State. Two or three more woolen mills have been completed since the assessors' reports were made.

LECTURE ON PUGET SOUND.—The Hon. Elwood Evans, of Olympia, delivered a lecture at Port Townsend, recently, on "Puget Sound—its Past, its Present, and its Future." To those who knew the great reputation of Mr. Evans, as an historian, —says a correspondent—the long and patient labor and unwearied research which he has bestowed upon his forthcoming work, "The History of Oregon and Washington," a rich intellectual feast was anticipated, nor were they disappointed. The lecture is to be published.

PETRIFACTION OF A HUMAN BODY.—The Troy *Press* gives an account of the recent removal of the body of a man who died some years since in the neighborhood of that city. It was in a perfect state of petrifaction; and was covered with a dry mold, which, when removed, revealed a surface almost as white and pure as marble. The body showed not the least particle of decay. Every feature and lineament was perfectly preserved, and when stood upright it presented the appearance of a finely chiseled statue.

MINING REPORTS.—The annual report for 1868 of the Haywood mine in Amador County, contains the following figures:

Number of tons of quartz worked, 30,794; average yield per ton for the year, $21.56; bullion, $658,378.70; bullion sulphurets sold, $3,500; bullion sulphurets on hand, less cost of working, $2,300—total, $664,-178.70. The company disbursed for expenses in mining, milling, repairs working improvements and putting their works in complete order, etc., $339,251.45, leaving a balance of $340,400 which has been divided among the stockholders. The employés are spoken of as highly efficient and competent.

The Gould & Curry Co., of Virginia City, Nev., reports its annual total receipts at $119,914, derived from ores taken from the upper croppings, from close assorting of the refuse, or the abandoned waste filled into the old chambers of the mine, from materials sold, and sundry other sources. All the labor for extracting said refuse material has been performed under contract, requiring the contractor to keep the mine in good condition, at his own expense, and to pay the company $1 for each and every ton of ore thus extracted.

The disbursements were $301,680. Over one hundred and eighty thousand of which was expended in working and exploring the mine, and over $65,000 was spent upon the large and reservoir mills, and for the reduction of ores at custom mills.

"It is obvious," says the President of the company, Mr. Bull, "that the heaviest portion of the expense of mining is included in the cost of transporting wood, timber, lumber and ores, and as I have stated before, it is beyond a question that at least one-third of this expenditure would be saved by railway transportation."

The Superintendent, David Bowie, says but little has been done in the way of explorations in any part of the company's ground, and that little—made at the sixth station during December, 1867—did not result in the discovery of any new body of ore.

The mill has been closed during the whole year, and many of the stores have been sold; but the reservoir tailings mill has been leased at $500 per month, and 5,000 tons of tailings have been sold at $10 per ton.

OLD PAPER MADE NEW.—A French journalist is said to have discovered a method of restoring printed papers of all kinds to the uses of the press. He plunges the printed sheet, no matter how badly soiled, into an alkaline solution of his own devising, and, in a few moments, the ink, the spots, and the letters disappear and the paper comes out as white as ever.

CALIFORNIA
BUSINESS UNIVERSITY
204 Montgomery Street.

Full particulars regarding our Practical Course of Studies may be had by calling at the University, or by addressing
17v17-ayl2p E. P. HEALD, San Francisco.

A NEW PAPER

Will be published on SUNDAY NEXT, November 1st, to be called

THE SPIRITUAL LIGHT.

Published (for the present) Monthly.

It is especially designed to promote the cause of SPIRITUALISM, and assist in the discussion and investigation of all subjects pertinent thereto; which will naturally include Religion, Philosophy, Ethics, Morality and Universal Liberty.

TERMS OF SUBSCRIPTION.—One copy 1 year (invariably in advance) $1; Three copies to one address 1 year, $2 50. For convenience of remission, Greenbacks will (for the present) be received at $1 25 to the dollar in gold—we hope soon to be able to receive them at par.

TERMS OF ADVERTISING.—One square, one insertion, $1 (equal to 10 lines of ordinary brevier type); One square 3 months, $2; One square 1 year, $5; One column, 1 year, $25; do. 6 months, $ 5; do 3 months, $10.

A copy will be sent gratuitously on application to the publisher, to all places where one cannot be seen at the Bookstores. Address GEO. G. W. MORGAN, Editor and Proprietor, 472 Harrison street, between Third and Fourth street; or, 1578 Post Office, San Francisco. 18v17t

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

A WARNING
TO ALL WHO ARE AFFLICTED.

Before the rainy season comes get cured of Rheumatism and Neuralgia, by herbs only. The receipt was given some years ago by an old Indian in New Orleans, and it has never failed to cure all it says. Many have been cured in this city and in Boston, and all say it is the best they have tried. Manufactured by MRS. MARY HIGGINS, Oregon street, two doors west of Drumm. Orders sent by mail or express attended to on receipt of $5 per bottle. 22v17-3m

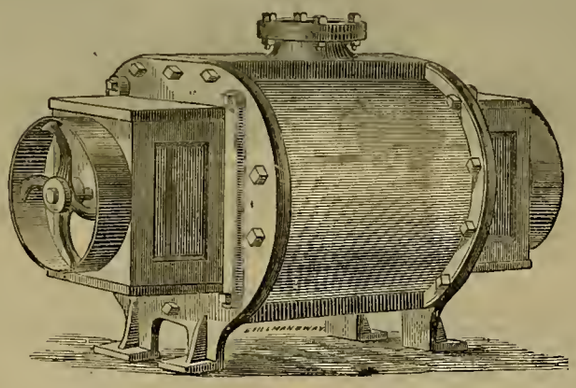
Small Pox.

We have been shown by Wm. Zelner, the best and most convenient and portable apparatus containing Chlorine, for rooms, which we consider the best disinfectant out, and should advise all housekeepers not to be without one. Price $1, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 18 Geary street, 25v17-3m

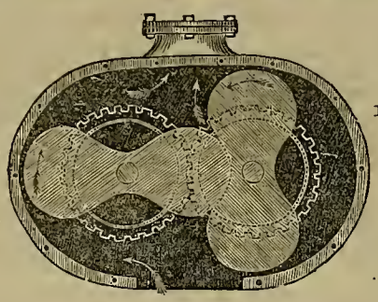
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

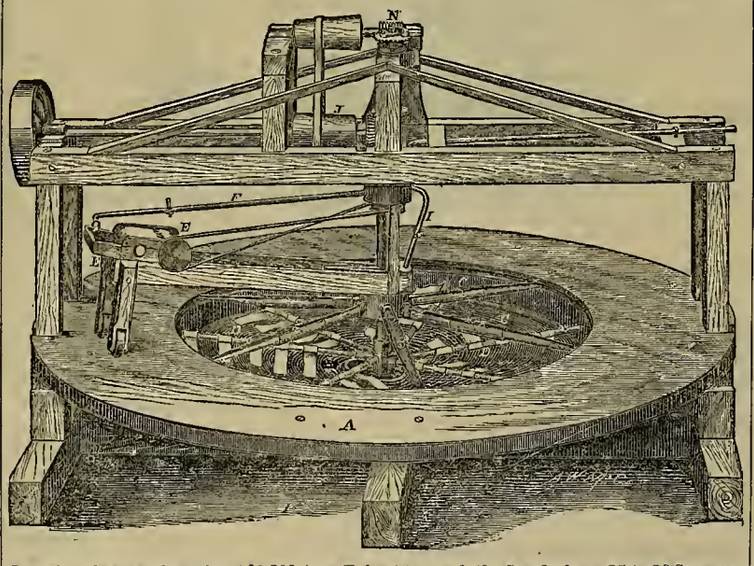
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps, Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.

WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 348.—Cinnabar, before roasting from, New Almaden; mixed with quartz and dolomite; the country rock being metamorphic magnesian limestone schists, more or less argillaceous, sometimes passing into a steatitic rock or serpentine, which may be derived possibly from the cretaceous shales or sandstones by metamorphic action. From Dr. Mayo, the Superintendent.

No. 349.—The same after roasting, and being divested of its quicksilver.

No. 350.—Quicksilver obtained.

No. 351.—Cinnabar beautifully crystalline, with diamond glance, disseminated through a quartzose magnesian limestone. From the quicksilver mine of Sundius Rabiless in the San Antonio Mountain, 12 miles from San Antonio, Santa Clara County. The mine has been opened to a depth of 90 feet, where the zone of impregnation is three ft. wide. It could be bought for about $60,000.

No. 352.—Napa sulphur, such as is used for the manufacture of powder at Santa Cruz.

No. 353.—Cake of Santa Cruz blasting powder.

No. 354.—Specimens of Santa Cruz limestone, granular and veined.

No. 355.—Santa Clara Valley tobacco, first years' growth being heavy, dark and oily.

No. 356.—Do. third years' growth, being light colored, fragrant, and improved in quality.

No. 357.—Three brands of smoking tobacco, manufactured from the above.

No. 358.—Glass from the San Francisco Glass Works. Presented by C. Newman, being the first flint glass ever made on this coast. It is as good a sample of flint-glass as is made in any State. These works were burnt down some time ago, but will be rebuilt and going at an early day.

No. 359.—Water fuse, triple taped, for igniting the charge in blasting in wet ground, from Tay & Bickford's fuse factory at Alameda.

No. 360.—Alum, in efflorescences, etc., and in considerable masses between crumbling pieces of argillaceous schist found in the Diablo range, easterly of San José. The country rock producing the alum is very brittle and full of fissures, which contain a great deal of this natural alum. The earthquake of Oct. 21st, shook down a large quantity of the rock from a cliff into a stream, and below pieces with which the water came in contact the margin of the stream was marked by a ridge of alum.

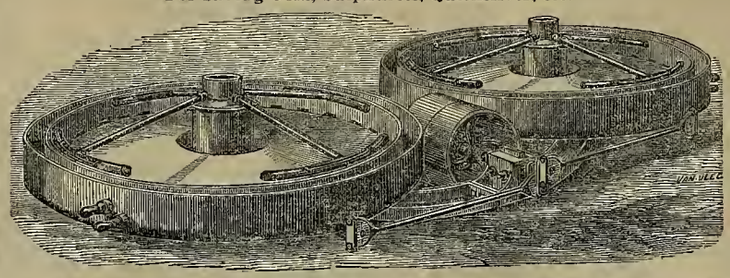
The natural production of alum from argillaceous schists has been observed in many different countries, and has been taken advantage of for the manufacture of alum, especially in Prussia, near Eislehen, where the *alaunschiefer* are manipulated skillfully into a number of valuable chemical products at little cost. Other localities of manufacture are Cape Sable in Maryland; Whithy in Yorkshire; Campsie near Glasgow; and Tolfa near Rome, Italy.

Alum is sulphate of alumina and sulphate of potash, or soda, or magnesia, or iron; making potash, alum, soda alum, etc. The natural chemistry is that the sulphur of iron pyrites or some volcanic source, changes, with oxygen, into sulphuric acid; and it is that which does the work. Which kind of alum this may be, we are unable to state positively without making an analysis, but it is probably potash alum. This is quoted in the last numbers of the *N. Y. Mercantile Journal* at four to six cents a pound wholesale.

The method of obtaining the alum in cases like this, is simply leaching, the mineral alum being soluble in 18 to 20 times its weight of cold water, or in a little more than its weight of boiling water. Judging from the specimens sent, it seems not improbable that quantities could be put into market from this locality at a profit to the producer. The question would depend upon the mount of labor that would have to be done to get the rock into a position to be leached. Presented by W. R. J., of San José.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868.

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARN & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address.

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

SOUTH AFRICAN GOLD FIELDS.—An exploring party is preparing to visit this region. "It will be",—says the Philadelphia *Ledger*,—"composed of well known travelers in Africa, and of assistants skilled in mining gold in California. A photographer will be attached to the party. The expedition will be absent for over a year, and will visit regions where no travelers have as yet been. Mr. Baines, one of the company, has already visited the Transvaal region. He describes the operations of the native goldsmiths as follows: They use a broken earthen pot for a furnace, and a small goat skin for bellows. The crucibles are made from the nests of the mason wasps, and the metal is cast into ingots five or six inches long by half an inch square. The ingots are made into bars by the use of a hammer on a small anvil, weighing three or four pounds. The natives use blowpipes made out of the section of a gun-barrel.

TEST OF TURBINES.—A communication from the Willimantic Linen Company, in the *Scientific American* of December 23d, certifies that pursuant to agreement between the agents of certain improved Fourneyron or peripheral discharge, and Jonval or bottom discharge turbines, a test was made with a view to ascertaining the relative amount of water required with the same fall, to drive the same machinery; and that the former drove 12¼ per cent. more machinery, but in doing so required 39 per cent. more water; thus leaving a result of 23 per cent. in favor of the Jonval wheel. The former was what is known as the Boyden turbine, manufactured by Kilburn & Lincoln of Fall River, Massachusetts; the latter was Collin's Improved Jonval as built at the Troy Turbine Works.

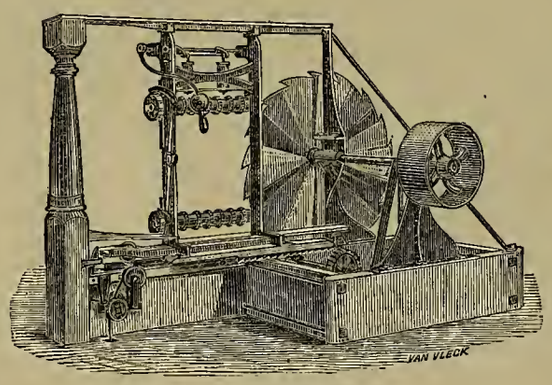
FISHES AND FINS.—In a paper addressed to the Academy of Sciences, M. Gouriet states that a sharply-pointed fin aids a fish to swim very rapidly, especially if it be bent in a scythe-like shape. If the fin be deeply scalloped, the result is the same; and fins that are rounded off generally denote slow swimmers.

ICE BOATING ON THE HUDSON RIVER.—They are having exciting times with their yacht-rigged ice-boats on the Hudson. On one occasion the fleet consisted of eight sail. Races were run,—and a mile a minute was made by several of the vessels.

Huntingdon's Shingle Machine and Shingle Making.

Next to lumbering and sawing, in the manufacture of a marketable raw product out of timber, the making of shingles and of the kind of material presented to the artisan by means of the shingle machine, are of the highest importance, in the amount of work of the kind that is done, and the extent and variety of the field supplied by machines of the kind represented in the engraving.

In principle the shingle machine is nothing else than a small, automatic, constant working sawmill, adapted to a special purpose; the difference between the products of the sawmill and of the shingle machine being that the latter are smaller and thinner, and turned out at the rate of several thousand cuts per hour.



HUNTINGDON'S PATENT SHINGLE MACHINE.

Wood-working is the first of all the industries that minister to, and constitute civilization, and we scarcely realize, any longer, in these days of machinery when the elements are working subserviently to the needs and advancement of mankind, how much we are indebted, in our daily comforts and conveniences, to the ingenious mechanical applications and variety of wood-working machinery. It is in this branch of invention especially that the Americans first won, and have since maintained, their reputation of a superior inventive capacity to that of other and sparsely forest-covered lands.

Everything but carvings, and even those latterly in a degree, can be had now at 'wholesale prices' from establishments whose profits and success are the result purely of the steam wood-working machinery employed. The shingle machine is a good example of the immense economy of doing such work by machinery, as sawn shingles are, at the same time, of the superior quality of the product over shaved shingles, and shakes.

Mr. Huntingdon's machine is one of the many inventions of the practical kind for which California is distinguishing itself. Though it does not claim any great novelty or degree of originality in its operation, the all-sufficient advantage is presented of working smoothly, and so rapidly as to turn out 3,000 shingles per hour, or 30,000 to 40,000 a day, with a 6-horse power engine.

The principal difference between this and other shingle machines, is that in this the block is set upright, and the saw cuts into it sidewise, instead of lengthwise, leaving the saw marks to run with the grain of the wood; which is more favorable to the flow and drainage of water, and consequently to the durability of the shingles; and by this arrangement the carriage has to move forward and backward only 17 inches, or the width of the block, instead of 30, or the length of the same, every time that it cuts off a shingle, enabling it to work quicker than any other machine, to 27 cuts in a minute, each cut being equal to about two shingles. It must be remembered that a "shingle" is a unit four inches in width; and in reckoning up totals it is done by bunches, four to a nominal thousand shingles, as lumber is reckoned by the thousand feet; the length of the shingle being 16 inches. Another feature of this machine is that it is made nearly all of iron, and is therefore very compact, easily shipped, weighing 10,000 pounds, and easily set up. An "edger," to straighten the edges, goes with the machine. To cut off the blocks to a proper length for the shingle machine, a separate steam-power drag saw is made, which does the work of twelve men with the common cross-cut saw. Usually shingle machines are run in connection with sawmills, and in the vicinity of where the wood grows.

The block is placed, by hand, in front of the circular saw, and between the two small cylinders seen in the cut with numerous toothed wheels, which hold it firmly and move it sidewise after every cut, by means of the ratchet attachments seen at the ends. All that is necessary in putting in or taking out a block, is to lift the lever represented, which elevates the upper cylinder.

By changing the setting of the ratchet mentioned, any desirable width can be cut from one-eighth of an inch to three inches. This is done when barrel-heads, box-boards, and the like are wanted.

The motion of the carriage in the direction of the saw, is imparted by the strap which is seen running down from the driving pulley, connecting by means of gearing with straight cogs under the carriage; in the opposite direction by means of weights depending by a cord, represented in the left hand corner as running down through the floor. This automatic motion may be as great or as small as is desired for the purposes in view, and has been made as much as 24 feet.

The wood used for making shingles is chiefly redwood, but also pine, spruce, and fir. They are made in the lumbering districts of Mendocino, Humboldt, San Mateo and Santa Cruz counties, and at Port Orford and Puget Sound; and amounted in 1866, as recorded on the books of the Lumber Dealers' Association, to 25,000,000. But the Huntingdon shingle machine alone turned out during the past year about 50,000,000 shingles, according to the manufacturer's estimates; while the Farris and other machines may have made 10,000,000 more. Two machines at Woodside, near Redwood City, made 13,000,000, and are cutting on an average 200,000 a week.

To make good roofs, especially in snowy countries, shingles are indispensable, as neither shakes nor boards are entirely adapted to the purpose. The price per thousand is $3½ to $4½; the latter having been the price in this market six years ago.

Amongst the parties who are using the Huntingdon machine, are McPherson & Wetherbee, and Pope & Talbot, San Francisco; Hanson & Co., Redwood City; S. P. Pharis, Woodside; Rice & Halliburton, Woodside; Harrington & Co., Pescadero; Burch & Co., Pescadero; R. Walton, C. P. R. R.; A. H. Davis and Sen. Carson. Machines have just been sent to Fort Ross, and to White Pine.

Further particulars may be obtained of the inventor and manufacturer, Mr. F. A. Huntingdon, No. 17 Fremont street.

MYRON ANGEL, the author of several valuable publications on silver mining in Eastern Nevada, has gone to White Pine to take charge editorially of the White Pine *News*. Mr. Angel was editor of the Austin *Reveille* during the palmiest days of that burg, and is a representative Californian in possessing that trait which tends to carry us into the very midst of everything important that is transpiring within our reach. More recently, Mr. Angel has been connected with the State Capitol *Reporter* at Sacramento.

SYMPATHETIC INK.—To make a sympathetic ink, mix lemon and onion juice. Writing made with this on plain white paper, will, when dry, be invisible. But on warming the paper before a fire the lines will appear in brown tints.

PLAYED OUT.—Hypophagy is not "a success" in Paris. Quite the contrary.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Manufactures at Santa Cruz and in Santa Clara Valley.

THE SANTA CRUZ TANNERY.

Editors Press:—I have just been paying a visit to the largest tannery in the State,—the Santa Cruz Tannery of Edmund Jones & Co.,—which is situated about a quarter of a mile from the old Mission, and has heen in constant operation ever since the year 1854. There are seventy-five double lay-aways, exclusive of limes, pools, and handlers. Hides are laid away from three to four months. The capacity of tho yard is 2,000 sides per month. The quantity manufactured last year was over 20,000 sides, the greater part of which was sole leather. Harness leather is made only in small quantities. The uumher of men employed is twenty-one. The California hides, and the bark used, are the best of the kind in the United States for the manufacture of sole leather; and as neither vitriol nor hot liquors are used in this tannery, the sole leather is superior for dureble qualities to any manufactured in the Atlantic States; but in consequeuce of their color being a little red, the prejudices of the trade there are hardly yet overcome. A market is being gradually made, however, for California leather of good quality in New York and Boston, particularly for light weights.

A small market is found in China and Japan, the latter more particularly, for harness leather, the Japanese army being accoutred according to the Europeau methods in infantry and artillery. Although the profits of the trade have been small for a year or so past, the fact that this State exports quite largely of this valuable product, tends to increase to a considerable extent the material prosperity of the country. This tanuery makes a specialty of pump leather for mining pumps, and we call attention, to those interested, to their advertisement in another columu.

I am iudebted to Mr. Joseph Boston, for kindly showing me through the estahlishment.

THE SOQUEL TANNERY

of G. K. & B. T. Porter, is distant from Santa Cruz four miles, and has fifty lay-away vats, and thirty men employed. The kind of work done here is mainly in the manufacture of upper leather. The San Francisco office is at the corner of Sansome aud Bush streets. I am glad to add that the Porters are doing an extensive busiuess.

LIME KILNS.

Three miles from town, on the coast road, are the lime kilns of Davis & Cowell, four iu number, and employing fifty men in the summer time. One of the kilns is a patented arrangement, which burns eighteen barrels a day easily; another is unusually large, being ten feet wide, and thirty feet long, and burning 1,200 barrels at a time. The other two kilns hold 1,000 barrels. All the coopering of the firm is done in the vicinity of the worke, the barrels being made out of redwood. The superinteudent is Mr. Henry Jordan.

Adams & Co., in the same vicinity, have a very fiue location, and thirty men employed. They turned out last year 30,000 barrels of lime.

THE LUMBER, LIME AND SHINGLE TRADE

has been very brisk the past year, and kuowiug ones give it as their opiuion that it will be more so the coming year. Shippers complain that there is need of more wharves. Santa Cruz possesses the largest lime kilns, powder mills, paper mills and tanneries in the State, while its lumber interests are developed, aud its grain aud flour shipments good. Seveu church buildings ornament the place with their spires.

IN SANTA CLARA VALLEY,

the Santa Clara Flour mills of L. Robinson & Co. have four ruu of stoue, running eighteen houre a day, and sixteeu hande employed; turning out flonr at the rate of 125 barrels in twelve hours. The quantity of wheat thet came into this mill between August 21st, 1868, and January 1st, 1869, was 8,400,000 (?) pounds.

THE TOBACCO FACTORY AT GILROY.

Messrs. J. D. Culp & Co. have developed a new industry in California, which promises, from its present and increasing success, to become important. The enterprise was begun in 1860, hy putting in a crop of tobacco on some land three miles from Gilroy, and encouraging farmers around to do the same; and by building a factory in town of 50x150 feet in dimensions. Good crops have been had every year since; and the only had luck encountered was the burning down of the works in 1866, by which the firm lost $12,000. Messrs. Culp & Co. employ twenty-four men. The machinery consists of a 30-horse-power engine; two large cutting mechines, capable of cutting from 3,000 to 10,000 pounds of tobacco per day; and six hydrenlic presses. The building and machinery together cost $10,000.

The farmers around have raised 300,000 pounds of tobecco; last year Culp & Co. raised 10,000 pounds. Raw tobacco is worth ten cents per pound; after it is worked up it is worth from forty ceuts to $1.10 per pound, according to quality.

The average yield por acre is ahout 900 pounds, although it has been known here to produce as high as 1,500 pounds to an acre, which, at the ordinary market value of ten cents per pound, hrings the producer handsome pay for his lahor.

In the Southern States it requires the labor of one man to each five acres to kill the tobacco worm, while in this couutry the insect known as the "yellow jacket," rids the planter of this expense—hunts industriously for the worm—and no sooner finds the game than his fatal sting is introduced and the worm falls lifeless, to satisfy the appetite of the insect—a portiou of which only is devoured.

Messrs. Culp & Co. expect this year to put into market 200,000 pounds.

[Written for the Mining and Scientific Press.

N. Y. Society of Practical Engineering.

The New York Society of Practical Engineering held its regular fortnightly meeting at the Cooper Institute Building, on Tuesday evening, January 19th; the President, Mr. James Whitney, in the chair.

The paper for the evening on the "Casting and Forging of Metals," was read by Mr. James Harrison, a founder and worker of metals, of New York city. The paper first gave an elaborate view of the many applications of the founder's art to practical purposes in the needs and luxuries of every day life. The railroad and the steamship, the kitchen and the parlor, the anchor aud the watch, were each shown to he similarly dependeut on the skill of the founder and metal worker. In the means of travel we have the powerful locomotive, the iron frame-work of the cars, the ponderous machine of the steamship, etc., as evidences of his skill. Iu domestic life there is the stove, the frame of the piano, the castors of the sofa, the locks and bolts of doors, etc., egaiu remiudiug us of the worker of metals. In agriculture we have the plow, the harrow, the thrashing and the winnowing machine, and many other instruments giving evidence again of the importance of the founder. The writer then proceeding to a description of the process, spoke of the preparation of the mold to receive the metal. This sübject involved the consideration of six distinct points:

First—The preparation of the sand or loam to suit tho different kinds of work. A mold that would resist the pressure of the molten metal in the casting of small pieces, would uot answer in the casting of large pieces. A variation is also needed in different cases, so as to allow of the escape of the air in the mold, and of the gas generated by the coutact of the metal with the cold sand or loam.

Second—Facing or blackening. The substauce used for this purpose depends on the kind of work to be done. Various materials, such as finely-powdered charcoal, plaster of paris, aud dried aud powdered fire-clay, are employed. The facing enables the molder to give his work a smooth finish. Care must be exercised in this connection, however, for if the facing be too thiu the motal will eat through the sand, making the casting rough, while if it is too thick, it stops the pores through which the vent should escape, and the mold is broken. The facing used for small work is not suitahle for large work.

Third—The "vent." By this is meant the escape of the air that is in the space where the melted metal is to go; not only the air, however, but the gas generated by the melted metal coming in contact with the cold sand must also escape. Should the mold be too open, the gas is allowed to rush through too fast, and will tear away some of the material of the mold, and the metal following, the casting will be lost. If, however, the vent does not escape fast enough, the metallic liquid will flutter in the mold until the casting is spoiled from the gas escaping through the surface of the metal. In order to obviate this difficulty, the writer recommended the use of a device which he termed a "riser." This is a round taper hole in the mold filled with a piece of soft clay loaded with a weight proportionel to the weight of the casting. If the gas escaped as fast as generated, *i. e.*, if the mold was made properly, the clay end weight would not move. If the mold had heen made too close, thus preventiug the gas from escaping, the clay and weight would he lifted up and the gas escape. This fixture constituted an easy method for the regulation of the escape of the gas.

Fourth—The gates or runners. These are the inlets hy which the metal is poured into the mold. The common way of simply pouring the metal from a ladle into a duct, which conveys it to the point, is a mode involviug all the disadvantages possible under the circumstances. The process of skimming the dross and slag from the surface of the melted metal as it is poured from the ladle, is always very difficult, and the following device proposed by the writer, is claimed to he a self-skimming runner. The metal is first poured from the ladle into a basin, from which it flows by a gutter to the opposite side of a smaller basin, and forms a current around the second basin, and then ruus to a third yet smaller then the second. A current is also produced here, and ou flowing from this hasin to a mold it has become purified. The explanation of the matter is thought to be that the circular current produced in the hasins causes the dross to accumulate in their centers.

Fifth—The size of the runners. This is also a very important consideration.

Sixth—The heat at which different metals should be poured. This was considered by the writer as the vital part of the art of molding. To the want of proper means for ascertaining the correct heat of the metal at the time of pouring, may be attributed nine-tenths of had castings. A pyrometer, which could he put into the ladle or furnace in such a manner that the instrument would not be injured, would he a very remunerative invention.

Tho mixing of metals was then considered. The fact that some cast iron is very hrittle, although it will in this state resist compression very strongly, was here noticed. Iron that has heen melted over and over again, comes under this category. A malleable iron for machinery castings may be made by mixing in the furnace as many different kinds of iron as possible. In most cases, iron melted in a cupola is not as good as iron remelted in a furnace. The quality of the iron is also affected by the quality of the fuel, and even the state of the weather. The blest had also a great influence upon the metal. The writer emphatically recommended that large castings, such as columns, shafting, etc., ehould be made hollow, and that the center should be allowed to cool first.

The casting of bells was spoken of in conclusion, and an instrument of music to he played in the same manner as a piano, was described. The tones are to he produced by the vibrations of bells of all sizes. This instrument, which was regarded as an important coutribution of the "founder artist" to the fine arts, is to have a range of seven and a half octaves.

The paper was listened to with evident interest, and at its conclusiou a discussion took place concerning the subject, after which the Society adjourned to meet again in two weeks.

Winter Visit to the Yosemite.—A party left Mariposa last week, with the intentiou of payiug a winter visit to the Yosemite Valley. They succeeded in reaching the South Fork of the Merced, when they ahaudoued the attempt.

Alpine County Items.—Mr. Chalmers, of the Imperial Silver Quarries Company writes, under date of February 5th:

I expect to run fifty-nine feet more in the trachytic tufa, end fifty feet in porphyry, before I reach my first ledge. Thanks for your insertion of my letter in reply to your Boise correspondent.

My friend Mr. Coulter is driving his Mt. Bullion tunnel, on the other side of the river, as fast as he can, and so em I, night and day, with as good a team as can be found in Alpine.

The Morning Star have erected excellent hoisting works, and are pushing down their shaft rapidly.

The Monitor Consolidated are busy with their mill, which they expect soon to have in working order.

The Scheuectady Company, better known as the Tarshish, are, I am informed, to commence work again vigoronely next month.

The Globe Company, in the same cañon, are driving their tunnel with all speed.

The Michigan Company, claiming to own an extension of the Tershish, but which is denied, are also at work on good looking ground.

The Forest Belt Company stopped work on the 16th ultimo.

Mr. J. P. Ray is busy on his Mountain cleim.

We have about twelve inches of snow here, and two feet at Silver Mountain, seven miles higher up.

Nevada Mining Patents.—A letter from Land Commissioner Wilson to Senator Stewart of Nevada, states that tho returns of survey for sixty claims have been received from the Surveyor General of Nevada; but in forty-four of these cases the reports, which the law makes, with the survey, a basis of patent, have not yet been received from the District Land Officers. Of the sixteen cases in which these have been received from Registers and Receivers, there are four in which adverse interests are asserted, determinable only in the local courts. Of the remaining twelve, patents have been prepared for the North Star, the Utah and the Knickerhocker gold and silver mining claims; while the Hale & Norcross claim, with several others, are now in hands for patenting.

"To enable the Executive to administer the law with as little disturbance as possible of the local miuing regulations and customs, and secure the ends of justice, it would be proper," says the Commissioner, "for each claimant to file, with his application, some appropriate evidence that he is the *bona fide* holder of a certain number of original claims, according to mining customs. All necessary testimony may be furnished in the form of affidavits and certificates, to obviate the inconvenience and expense of taking witnesses to the land offices, frequently at great distances from the premisee claimed."

How to Stop Oil Fires.—A correspondent of the Rochester *Union* writes from Titueville, Pa.: "Allow me to suggest how a crude oil fire may he managed, for with the large amount daily passing through your city on cars, some day you may have one. Keep the water away from it. As the burning fluid will, of course, run, the first thing, and the great thing, is to dam it. Anything will do; a board stuck across the gutter or wherever the oil may be running, will answer until it can be secured with mud. Then make a hole near the bottom of the dam, and if a pipe is handy, put it in and allow the oil to run off. This oil will not be on fire, as the flame always lies on the surface. When the oil is lowered so that the hole or pipe would soon be exposed, stop up the opening, else the flame will follow. Then let the oil that may be left burn at its pleasure. The advantage of a pipe or tube consists in carrying tho saved oil so far from the burning mass that the gas from the oil may not ignite from the flame. If water should be thrown on the burning oil, its only effect is to bear the flaming fury onwards whithersoever the water bears it, into cellars, stores, and —ell over."

Metric Standards.—The Superintendent of the Coast Survey, in a letter to Secretary McCulloch, says fifty sets of metric standards of length are in process of construction. The Superintendent recommends the appropriation of $20,000 for the construction of metric standards to be furnished each State, according to the Act of July 28th, 1866. The reason for constructing fifty sets is to have enough to supply future States.

Mechanical.

ROPE-BORING A CHINESE INVENTION.—Mr. Warrington Smyth, in a recent lecture at the Royal School of Mines, said: "A plan of boring now much employed, and which we owe to the Chinese, is that with ropes instead of rigid rods. French missionaries in the 17th century had observed that the Chinese had methods of boring to enormous depths. Father Imbert, having made a communication to the French Academy, to the effect that the Chinese borers had attained a depth of 3,000 feet, the statement was discredited. Eventually travelers established the fact; and now it is a matter of discussion whether it is not a method which will compare well with any of the more modern ones. The ropes used by the Chinese are made of strips of bamboo, and those of England are the ordinary hempen or wire-ropes. In consequence of the greater elasticity of ropes, it becomes necessary to give a longer stroke at the top, so that for a stroke of ten feet at the bottom it is necessary to give one of twenty feet at the top. The tool used ranges from 3 cwts. to half a ton. The Chinese employ either our common spring pole, or a rope passed round an enormous cylinder fifty feet in diameter. It was by means of this cylinder that the missionaries ascertained the depth of the borings. They took the circumference of the drum, and found that the rope went sixty-two times around it. This method of boring seems to possess such advantages that at first sight it seems wonderful that it is not universally employed, but it has many drawbacks. Among these are the occasional breaking of the rope, and the consequent impossibility of withdrawing the tool,—and the difficulty of preserving the perpendicularity of the hole, in case of a change in the hardness of the beds which are passed through."

LUBRICATING OILS.—*Peasc's Oil Circular* says first-class oils are more in demand. From 30 to 50 per cent. of power is lost for lack of knowledge in reference to the laws of friction and the effects of heat and pressure upon the oils used. Thousands of dollars are annually saved by those railroad managers who give the subject proper attention. "There is no occasion for a hot journal on any road under ordinary circumstances, if proper oils are used. There is no occasion for cutting of journals and destruction of valve-seats, if a little thought would only be given to the subject. The wonderful chemical effect of some of the poor cheap oils upon the iron surfaces and journals of some of the roads is often overlooked. Has it ever occurred to railroad men that the use of oils of strong acid reaction has a tendency to weaken the strength of the boiler itself, as they have the power to cut and destroy the bolts of the steam chest and cylinder?"

BLAST PIPES.—The diameter and position of the pipe, the diameter of the chimney, and the size of the fire-box, tubes and smoke-box, are all concerned in the effect produced. According to investigations by Mr. D. K. Clark and others, it has been shown that the vacuum in the smoke-box is about seven-tenths of the blast pressure; that the vacuum in the fire-box is from one-third to one-half that in the smoke-box; that the best proportions of the chimney and other parts are those which enable a given draught to be produced with the greatest diameter of blast-pipe, because the greater the diameter the less is the back pressure produced by the resistance of the orifice; and that the same proportions are best at all rates of expansion and at all speeds.—*American Artisan.*

THE STEAM HAMMER.—The French claim the invention of the steam hammer for M. Mourdon, who took out a patent in April, 1842,—whereas Mr. Nasmyth, they say, did not take out his patent in England until June of the same year;—having, moreover, visited the iron works of *Le Creusot*, Burgundy, between these two months.

Morton's Ejector Condenser.

The London *Artizan* for January contains a paper recently read before the Institute of Scottish Engineers by Prof. Rankine, giving an account of experiments made by him with this condenser. We quote a portion:

"The principal parts of the apparatus may be thus described: The cold water passes from the tank to a conoidal nozzle; the area of the orifice of that nozzle is about equal to that of the injection sluice of a common condenser suited for the same engine; that is to say, about 1-250th part of the collective area of pistons. Enveloping the cold water nozzles are a second and a third nozzle of nearly similar figure; these bring the exhaust steam from the two cylinders respectively. The middle nozzle has an orifice a little larger than that of the innermost, or cold water nozzle; the outermost nozzle ends in a throat or contracted vein little larger still, beyond which is a gradually widening, trumpet-shaped mouthpiece, leading to a pipe which ends at the hot-well. The condensation of the steam takes place in the interval between the orifice of the cold water nozzle and the throat of the outermost nozzle.

"The principle of the invention may be described as follows: In every injection condenser the cold water rushes into the vacuum with a velocity of 43 or 44 feet per second. The exhaust steam rushes from the cylinders into the condenser with a velocity which is many times greater than that of the water. In the common condenser those rapid motions of the water and of the steam are completely checked, and their energy is wasted in agitating the fluids in the condenser, and ultimately in producing heat; and hence it becomes necessary to use an air pump in order to extract the water, air and uncondensed steam from the condenser. The power expended in working a well-proportioned and well-constructed air pump is known by experiment to be equal to that which would overcome a back pressure on the steam piston of from ⅛ to ¾ lb. on each square inch of its area, or on an average about 0·6 lb. on the square inch; and that amount of power is lost through the wasting of the energy with which the jets of water and steam rush into the condenser. In the ejector condenser the motion of those jets meets with no interruption; and its energy is found to be sufficient, without any assistance from pumps, to carry all the water, air and uncondensed steam (if any) completely out of the condenser and into the hot-well, and thus to save the power which would be required to drive an air pump."

BRONZING IRON CASTINGS.—The delicate Berlin iron castings are bronzed for their better preservation against rust, by means of a peculiar paint, of which ferro-cyanide of copper forms the basis. When an article has been coated with this paint, and before it is quite dry, if dusted over with copper bronze powder and allowed to dry thoroughly, the effect will be that of bright copper after being polished. A green bronze tint is produced by washing with a solution of acetate of copper. When perfectly dry, the higher parts of the casting must be rubbed with a piece of clean rag to bring out the brown copper color; it will then appear like a bronze that has become green by age. If the bright copper-colored bronze above mentioned be brushed over with black lead it will produce the brown bronze. Yellow or pale bronze, is obtained by using yellow bronze, or brass powder, instead of copper powder.

THE FIRST LOCOMOTIVE IN AMERICA.—The "Old Ironsides," built in Philadelphia in 1832, by M. Baldwin, from a draft by Rufus Tyler, had wooden wheels with broad rims and thick tires,—the flange being bolted on the side. She ran a mile an hour. The tender was placed in front, in order to keep the two light wheels of the engine on the track. The wheels finally went to pieces, and were replaced by iron ones. The engine is still in existence.

WIRE ROPE.—At the Havre Exhibition, the wire rope of Scott & Co. was awarded the prize medal. "A piece of 4-inch steel wire rope stood the enormous strain of forty tons, and slipped through the splice without breaking,"—says a London correspondent.

Scientific Miscellany.

Chemical Geology of California Gold Fields.

Silliman's Journal for January, has an abstract of J. Arthur Phillip's "Notes" upon this subject. The general conclusions of the author are here given:

a. Quartz veins have generally been produced by the slow deposition from aqueous solutions of silica on the surfaces of the enclosing fissures.

b. From the general parallelisms with its walls of the planes of any fragments of the enclosing rock which may have become imbedded in a vein, it is to be inferred that they were mechanically removed by the growth of the several layers to which they adhered, and that a subsequent deposition of quartz took place between them and the rock from which they had become detached. In this way were introduced the masses of rock known as "horses."

c. The formation of quartz veins is due to hydrothermal agencies, of which evidences are still to be found in the hot springs and recent metalliferous veins met with in various parts of the Pacific coast.

d. From the variable temperatures at which the vacuities in their fluid-cavities become filled, it may be inferred that they are the result of an intermittent action, and that the fissures were sometimes traversed by currents of hot water, whilst at others they gave off aqueous vapor or gaseous exhalations. This is precisely what is now taking place at Steamboat Springs, where the formation of a vein is in progress, and from which currents of boiling water are often poured forth, whilst at other times the fissures give off currents of steam and heated gases only.

e. That gold may be deposited from the same solutions which gave rise to the formation of the enclosing quartz, appears evident from the presence of that metal in pyrites enclosed in silicious incrustations, as well as from the fact of large quantities of gold having been found in the interior of the stems of trees, which in deep diggings are often converted into pyrites.

f. The constant presence of iron pyrites in auriferous veins, and when so occurring its invariably containing a certain amount of gold, suggests the probability of this sulphid being in some way necessarily connected with the solvent by which the precious metal was held in solution. It has been shown that finely divided gold is soluble in the sesquichloride of iron and, more sparingly, in the sesquisulphate of that metal. It is also well known that iron pyrites sometimes results from the action of reducing agents on the sulphates of that metal. If, therefore, sulphate of iron, in a solution containing gold, should become transformed by the action of a reducing agent into pyrites, the gold at the same time being reduced to the metallic state, would probably be found enclosed in the resulting crystals of that mineral.

g. The silica and other substances forming the cementing material of the ancient auriferous river beds have probably been slowly deposited at a low temperature.

TO DETECT ATMOSPHERIC AIR IN COAL GAS.—Dr. Werner, of Breslau, gives the following method: Ten parts by weight of anhydrous sulphate of protoxide of manganese are put into a two-necked Woulf bottle, dissolved in twenty parts of warm water. To this is added a solution of ten parts by weight of tartrate of potassa and soda (Rochelle salt), dissolved in sixty parts of water; the thorough mixing of the fluids is promoted by shaking of the bottle; after this there is added a quantity of a solution of caustic potash sufficient to render the fluid quite clear; immediately after this corks, perforated with tightly-fitting glass tubes, are placed in the necks of the bottle, which should be entirely filled with the fluid. One of the tubes—the inlet-tube for the gas to be tested—should just dip a little under the upper level of the fluid; the outlet tube should only reach half-way the perforation of the cork. A very slow current of gas is now made to pass through the fluid, and kept going for at least a quarter and at most one full hour. In case the gas is quite free from atmospheric air, the fluid in the bottle will remain quite clear; if traces of air are present, a faint coloration of the liquid will soon become apparent; with a larger proportion of air the fluid will soon be rendered first light-brown colored, and afterward intensely black.

EVOLUTION OF THE NORTH AMERICAN CONTINENT.—We condense a part of Prof. Hall's recent lecture upon this subject before the American Institute:

"In the formation of the continent, the material composing it have been derived from the breaking down of pre-existing materials transported and deposited along certain lines, or spread out in mid-ocean and there accumulating uniformly. The inequalities upon the surface of the country are not due to any special action along these lines of elevation. Those mountain ranges, whether the Rocky Mountains of the West, the Appalachian chain of the East, or any other chain of mountains, so far as we know, are not due to any action or any forces along those lines, but only to the greater currents in the bed of the ocean near those lines. Everywhere the same law has prevailed. The transporting power of the ocean has deposited in the line of its currents larger quantities of material. The elevation has been a continental one, and not the elevation of a mountain or chain of mountains. The elevation of the eastern portion of the North American Continent has nothing to do with the mountain change constituting a portion of the continental elevation. Going back, then, step by step, from the more recent to the earliest times in relation to which we have any evidence whatever, we have no proof that the action of the interior of our globe has produced any of the great features of the globe. This idea of a great primary nucleus is only theoretical. It has not in it anything tangible. The earliest rocks of which we have any knowledge were deposited by the ocean under conditions similar to those which now exist."

THE VOLTAIC ARC.—The bluish space between the brilliantly incandescent charcoal points which give the electric light,—curved in form when the points are in a horizontal line, owing to ascending currents of heated air, and hence called the voltaic arc,—is the route taken by the electric current in passing from one of the points to the other. What is its nature? It is carbon in some form, but what form? Fine dust, vapor or gas? In an article by F. P. Le Roux, in the *Chemical News*, the writer says that recent experiments of his have led to the belief that it is evolved from the positive pole; and that it is due to a special source of heat at that point, hitherto unexplained. We quote a portion of the article: "The positive charcoal is considerably more luminous than the other, and its incandescence of longer duration. I am even inclined to believe that the negative charcoal is heated almost entirely by the radiation of heat from the positive charcoal on one hand and the arc on the other, and by the heat proceeding from the condensation of the matter conveyed by the latter. I have made an experiment which will show that the heating of the positive pole is owing to a special cause, the seat of which is the exact point where the voltaic arc joins the charcoal. The experiment consists in this: The charcoal electrodes are first brought into contact in the ordinary manner, and then separated so as to produce a very short arc of only a small fraction of a millimeter, which is interrupted at the end of some seconds; the positive electrode will then be found to remain incandescent for some time, whilst the extremity of the negative electrode will be scarcely red."

GALENA IN THE LABORATORY.—M. F. Muck states that crystallized cubes of galena are obtained by the action of HS on hot solutions, strongly acid, of nitrate of lead, the hotter and more acid the better. Even solutions nearly neutral, if partially precipitated, so as to render them acid, afterwards yield crystals. Precipitates from the acetate and chloride of lead are wholly amorphous. Becquerel, de Senarmont, Bischoff, Brush of Yale College, and others, have already obtained galena in the wet way. It is stated that Flach, by placing a stick of brimstone in an alkaline solution of oxide of lead, obtained,—after some years,—deposits, both on the stick itself and on the walls of the vessel, covered with small cubical crystals of galena, recognizable without a magnifier.—*Prof. Wurtz—Gas Light Journal.*

SOLAR HEAT UTILIZED.—Prof. Mouchot, of Tours, France, announces a work upon this subject, soon to be in press. In 1864, Prof. M. constructed a small steam engine operated by means of a "solar boiler;" and he has since contrived various pieces of apparatus, on the same principle, for cooking, distilling, etc.

Character of the White Pine Ore Deposits.

The following from Mr. Albert S. Evans' judiciously-sifted and very useful notes, may assist those who have felt themselves under the disadvantage of possessing limited data, in arriving at conclusions satisfactory to themselves:

TRUE VEINS.

When the writer visited the district in November it was still an open question whether there was such a thing as a true fissure ledge to be found there; many—the writer among the number—inclining to the belief that *all* the mineral was in merely horizontal deposits of sedimentary origin, and their permanency a matter of great doubt. Candor compels a full and unqualified admission of the falsity of such conclusion after a second and more minute examination made since the mines were more thoroughly opened, and recent and important developments have been made.

That there are well defined, genuine metal-bearing, perpendicular fissure ledges in the White Pine District, is no longer a matter of question; and that fact once positively established, as it now is, all doubt of these mines lasting for years under any system of working may be set at rest once and forever. Probably nine-tenths of all the claims located in the district are on horizontal deposits; but real fissure ledges have been found there nevertheless.

SOUTHERN SLOPE OF TREASURE HILL.

The most perfectly defined wall rock which is to be seen in any mine visited by the writer is found at the California, on the southern slope of Treasure Hill, some 1,500 feet below its summit, and only about half a mile east of the town of Silver Springs. This mine has been but imperfectly opened, but enough has been done to show that the ledge is of great thickness, and that it runs down deep into the bowels of the earth. The open cut across the ledge shows ore in abundance in a concentrated vein, which is from eight to twelve feet in thickness at least—the northern, or foot wall, not having been reached as yet. The ore runs from $100 up into the thousands per ton, rich chlorides being found with the lower grade conglomerate rock. The ledge runs nearly due east and west, and pitches out of or away from the hill southwards at an angle of say 15 or 20 degrees, the banging wall of bastard slate being as well defined as any to be found in any mine on the continent.

NORTHERN SLOPE OF TREASURE HILL.

Returning from the southern end of Treasure Hill toward the northern, we again come upon defined ledges. Treasure Peak is the name given to the bold crest of Treasure Hill directly north of Treasure City and east of the road to Hamilton. On the southern edge of this peak or crest is the Hidden Treasure mine, with its extensions. This mine—or one title to it: there are conflicting claims—was recently sold for $200,000, apparently a very low figure. The first ore found here was in a large undefined mass, and the existence of a defined ledge was a matter of doubt, but recently immensely rich rock held together by horn silver has been struck in seams pitching into the hill, and the deposit is assuming more and more the form of a ledge. Following around the abrupt eastern face of the hill in the strata of dolomite, which here crop out sharp and bare, is found a more or less broken line of deposits, apparently the outcropping of the same ledge or deposit on which are located the two Hidden Treasure extensions, Morning Star, Hunt & Drynen, Rough & Ready, Laynes & Murphy, Mammoth, Oriental, Green Above the Red, Virginia, and other claims, the latter being well down the hill towards Hamilton. Descending the hill towards Hamilton the ore becomes somewhat more refractory in character, the purest metal as a rule being found on the top of the hill, or towards the south in the direction of the Eberhardt.

DEPTH.

We have thus defined ledges at the northern and southern ends of Treasure Hill. A thousand shafts and cuts sunk or run in the intervening ground, the majority of which have struck metal in some quantity, demonstrate that Treasure Hill, for a space of at least three miles north and south, and two east and west, is everywhere metalliferous at some depth; the only question is whether you strike the metal at ten feet or a thousand.

Is there now any chance for doubt of the permanency of the Treasure Hill mines? In the opinion of the writer, who but recently thought differently,—*none whatever.*

HORIZONTAL AND VERTICAL DEPOSITS.

Old miners in the White Pine District, among them Dr. E. X. Willard, of the Keystone, now incline to the theory that there are two distinct classes of metalliferous deposits or veins in White Pine District. The first in the form of horizontal deposits, probably of sedimentary origin, lying between the strata of bastard slate and dolomite or limestone, and pitching westward from the eastern edge of Treasure Hill; and the second, and more permanent, in the form of true fissure veins, ledges or lodes, standing at or near the perpendicular in the center of the hill, and pitching outwards at the north and south. These ledges cut directly through the horizontal deposits from east to west, and it is at the point of intersection of the two in every case that the richest and largest deposits of chloride, horn silver and other immensely valuable forms and combinations of the precious metal are to be found. The recent developments in the Eberhardt and Keystone, and other mines, in less degree, go far to prove the entire correctness and reliability of this new theory.

THE EBERHARDT IN THE SOUTHERN SLOPE.

The Eberhardt and Keystone—first located as separate claims, having been shown to be identical, being enclosed between parallel walls running across Treasure Hill east and west, have been, by mutual consent of holders, consolidated, the agreement taking effect February 1st, 1869—will henceforth be worked by one company, which will soon be incorporated, with an office in San Francisco. The Richmond claim, which runs into the Eberhardt from the southeast, having been defeated, after a warmly contested trial, at Austin, and the Blue Bell and Grey Eagle absorbed in the Eberhardt title, there is now a clear field before the company, and work, which has been going on but very slowly for some months, will again be pushed ahead with vigor. Visiting the Eberhardt last week with the foreman of the company, John Bicknell, Esq., the writer went through the whole underground works, and was politely shown all points of interest. There are now fairly defined parallel north and south walls running westward into the hill. The south wall commences just below the old Blue Bell shaft, and forms the southern boundary of the Eberhardt, while the north wall forms the northern boundary of the Keystone ground, and both pitch slightly to the northward as they descend. The space between these walls is 183 feet from north to south, and a careful examination in the drifts, made step by step with the aid of lighted candles, and with hammers and picks, enables the writer to say with positiveness that the deposit of silver of wonderful richness is *unbroken from one to the other.* There is not a foot between the two walls where ore worth $100 to $20,000 per ton cannot be thrown down with a pick and gad. Marks of the pick in solid silver could be seen all along the sides of the chamber, and in one place we noticed where an iron gad had been driven into the soft metal to a depth of four inches, and withdrawn, without even cracking the surface of the ledge. The Blue Bell shaft was then down 120 feet from the surface, close alongside the south wall, into and through which it cuts at 100 feet depth. To the point of 100 feet there is ore nearly all the way down, a "horse" occurring at 40 feet. Beyond the point where the vertical shaft cuts through the south wall, no ore has been discovered, but at about the same depth in the Keystone ground, just south of the north wall, exceedingly rich ore has just been struck. How far the walls now being followed run westward into the hill cannot of course be told at present, but the amount of treasure which it is already evident they inclose is beyond anything like sober calculation. The ore from the Keystone and the Eberhardt ground—now in one mine—already reduced to bullion, or extracted ready for reduction, will approximate two millions of dollars, and there is no indication of a failing in quality or quantity at any point. The cash value of the mine as it now stands we will not attempt to estimate; it would take too many figures.

AUSTIN OUTFLANKED, BUT NOT "GONE IN."—The *Reveille* says: In spite of the facts which smart people chuck at us constantly—facts resulting from stock-jobbing, speculation, mismanagement, inexperience and stupidity—we know that Lander Hill contains veins of the noblest sulphuret ore, sufficient to maintain a population of ten to twenty thousand persons. This is not an idle statement. Instead of croaking about White Pine—which has done us no real evil, but is destined to work us much positive good—let our citizens put their shoulders to the wheel, instead of crying to vain gods for help.

Engineering.

BUILDING OF THE HONDURAS INTER-OCEANIC RAILROAD.—This work, it seems, is so well under way, and so definitely progressing, that we may count upon its early completion as a certainty. Being entirely in the hands of European capitalists, the engineering operations thus far reported have been undervalued in their importance to the Pacific coast. It is claimed that the completion of the Honduras Railroad will effectually terminate the carrying of freight and passengers between New York and California via Panama, because that route saves upward of twelve hundred miles of distance and seven days' time, passes through a healthy country, and possesses what Panama does not—deep, safe and capacious harbors at the termini of the road, where the largest steamship can tie up securely at the wharves. A letter received in this city from M. Lefevre, Trustee for the Honduras Government Railway Loan, dated in London, states that the "plant" and materials for the first section of the line from Puerto Caballos, on the Atlantic, to Santiago, have long since reached their destination, and that the work is now being vigorously prosecuted by Messrs. Waring Brothers and McCandlish, the contractors. Messrs. Bischoffsheim and Goldschmidt, bankers of London and Paris, who are the agents and administrators of the Honduras loan, are at the head of the enterprise, and London, Paris and Amsterdam capital is subscribed to build and complete the road. It will be in operation, unless contracts and promises are violated, in three years from June last, or in 1871. The Pacific terminus is the Gulf of Fonseca, and the total distance is only about 170 miles—a mere trifle in these days, especially when we consider the importance of the enterprise.

BLASTING OUT BLOSSOM ROCK.—Lieut. Huer's plan for blasting out Blossom Rock, in the ship channel of San Francisco, will, it appears, probably be adopted. Lieut. Huer proposed that a raft be floated over the spot, and a number of adjustable iron rods or supports be let down so as to stand on the rock, to support and steady the raft, like the legs of a table, their length varying according to the irregularities of the surface of the rock. In this manner a steady support would be secured for any number of men at once, while working at drilling holes, and the same number of blasts could then be let off simultaneously. As soon as the holes are bored, a charge of nitro-glycerine is to be poured down through an iron tube; being heavier than water, this would sink to the bottom of the hole. Explosive cartridges being next inserted, and connected by means of wires with an electric battery, the raft is to be floated away to a little distance, while the entire number of blasts are discharged by the electric spark. The same operation would be repeated, after removing the loose materials, until the required depth should be attained. According to Lieut. Heur's estimates, the work could be accomplished in this manner for $60,000; while by any other method it would cost five times that amount, or $300,000. By reference to the Congressional reports, it will be seen that an appropriation has been included for blasting out Blossom Rock.

THE HIGHLAND SUSPENSION BRIDGE across the Hudson, between Anthony's nose and Fort Clinton, is being undertaken in earnest, and will be the most stupendous engineering work of the kind in the world. The total length is 2,449 feet; length between the towers, 1,665 feet; estimated cost $3,500,000 to $4,000,000.

Two new pile-drivers have been sent out, with the usual material, for the Western Pacific Railroad, to be used in the construction of the bridge over the Cosumnes. The tracklayers are now in the immediate vicinity of that stream.

THE C. P. R. R. PIONEER AND CONSTRUCTION TRAIN is described by a correspondent of the Santa Clara *Union*, as follows:

The pioneer train is composed of 10 or 11 large cars. They look very much like houses on wheels. In the forward car is Mr. Strowbridge's residence and office. A battery is on the car, and an operator to work it. The train moves on to the end of track each and every noon and night, when a wire is attached and the circuit made. In the back cars of this train are eating or sleeping accommodations for the 500 men who compose the vanguard of this modern army. Attached to the train are three or four platform cars, on which carpenters, with shops fitted up in the best style, are fitting up telegraph poles, putting on insulators, etc., for the line, which is kept three miles ahead of the railroad. At every important station on the railroad is a telegraph office, and through these daily supplies are ordered up.

NEW CANAL.—Parties in Stockton have in contemplation the cutting of a canal from a point just below the shipyard of the Navigation Company to Mormon Slough. It is intended to make it sufficiently deep for any of the steamers or sailing vessels that now come to Stockton.

RAILROAD ROUTE THROUGH THE ALAMEDA HILLS.—The Pacific Railroad Company's surveyors have been at work the past week in Crow Cañon, Alameda County, having completed the survey on the Amador road. It is reported that the surveyed route is the cheapest and best yet found.

THE tunnel at Livermore Pass which is being constructed for the Western Pacific Railroad, is already 1,160 feet in, and 170 feet underground. It is expected that it will be completed at the same time the road will be—in July.

THE SUEZ CANAL will be completed the 1st of October, 1869, and the total cost of its construction will be 400,000,000 francs, or $80,000,000.

A COMPANY is to be formed in Sonora for the establishment of a line of telegraphs between Guaymas and Ures.

New Inventions.

PACKING FLEECES.—James Walton, of Douglas County, Oregon, has invented a machine for pressing and tying fleeces of wool. The operation is said to be performed with ease and rapidity. A patent has been applied for.

A NEW MIRROR.—It is said that a French chemist has invented a new way of preparing glass for mirrors. It is coated with an exceedingly thin layer of platinum, and becomes, mysteriously, not only a perfect mirror, but also remains so transparent that it may still be used for windows.

MEXICAN RIFLE.—A new rifle has been invented by Don Juan Adorno, called the Adorno rifle. It has four chambers or barrels, and is said to be superior to the Prussian needle gun or Chassepot rifle. This arm awaits the approval of the Mexican Government, for defense of the frontiers and haciendas.

WOODBURY'S PHOTO-RELIEF PRINTING. Among the marvels of science, says an eastern exchange, a new invention may be recorded which is likely to create a new and powerful interest in photography. The want of a process by which the advantages of this beautiful art might be obtained mechanically, and without the aid of sunlight, has long been felt; it is now by Mr. Woodbury's Photo-relief process an accomplished fact. Pure blacks and whites can be given easily enough, but the half tints, which consist nine-tenths of a good photograph, have puzzled many experimenters to master. In Mr. Woodbury's photo-relief printing the picture is produced with every gradation of a continuous tint, and by mechanical printing sufficiently rapid to complete with copper-plate or lithography.

METHOD OF SEASONING WOOD.—A new method for seasoning greenwood in a very short time, consists in boiling it for some hours in water, by which the soluble substances are removed. It is then boiled in a solution of borax, by which the insoluble albumen of the wood is rendered soluble and escapes also from the pores. The wood is then placed in drying chambers heated by steam, and allowed to remain three days. Wood thus treated is said to be more compact than it would be by ten years of ordinary exposure, it does not shrink or warp, and is secure against decay.

AMERICAN corn-cobs are sold in the streets of London as "Patent Fire-lighters—eight for a penny."

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, February 13, 1869

Financial.

Our local money market presents a very marked and healthy contrast to the deranged, unreliable and panicky condition of these of the East. Financial affairs in the Atlantic States are evidently in a bad and precarious state, standing on the verge of a volcano, and by no means satisfactory. On the other hand, although there is a very active demand for money, with us, the supply is fully equal to all emergencies, and at unchanged rates. The demand comes mainly for large real estate operations, and gigantic enterprises calculated to meet the advancing wants of the State, such as the construction of railroads: working many new and rich mines; aiding mining interests; erecting new factories; enlarging the area of farming operations; building new steamboats, and the like. This is a different sort of showing from that which prevails at the East, where business is stagnant, and sharp cornering operations, and speculations on the fluctuating values of paper money absorb the attention and capital of the wealthy. Should a crash occur there it would undoubtedly affect us to some extent; but we are so trenched in financial solidity that any serious damage would be averted. In consequence of the excessive rains, which have fallen steadily for nearly a week, communication with the interior has been sadly interrupted, and our supplies of bullion materially lessened. Thus far we have been favored, beyond former precedent, with free and undisturbed interior intercourse, and advantage was taken of it to forward large supplies, keeping up an active, profitable jobbing trade. Rates in bank remain steady at 1@1¼ per cent. per month, and 10 per cent. per annum for large sums on long time.

Receipts of gold bars have greatly diminished, from the cause before mentioned, but the supply on hand is sufficient for immediate wants. We quote them at 880@890; silver bars remain from par to ¼ per cent. premium; currency bills on Atlantic cities pay 32½@32¾ per cent. premium on gold; coin drafts, payable at sight, rule at 1¼ per cent. premium; telegraphic transfers, 1½ per cent. premium; sterling exchange is quoted at 48¼@48¾d; commercial exchange, 49@49¼d; Mexican dollars command 5½@6 per cent. premium over gold.

The fluctuations attending Pacific Mail stock in New York during the past week were very marked, sinking from 116 on the 6th of February to 110¼ on the 8th, and rising to 115⅜ on the 10th. One of our prominent bankers purchased to the value of $100,000 or more, when the stock had reached its lowest point. American Government securities are finding unusual favor in the European markets. Cable telegrams inform us that they had run up to 77 in London, the highest point yet reached, and Rothschild is reported to have invested in them to the tune of $2,000,000.

The wide-spread spirit of speculation engendered by an inflated and unstable paper currency, and the mushroom success which has attended transactions in Government contracts during and since the war, seem to have corrupted nearly the whole nation. The denizens of this coast are shocked to learn, by every mail, of gross frauds, and grand peculations, either perfected or in embryo, to rob and plunder the Government. It really seems as if the spirit of patriotism, of honor, of common honesty, were submerged beneath the waves of an ocean of corruption and brazen villainy. Instead of limiting the operations of a vigilance committee to New York City, the organization should have a national extension.

The deeds for the transfer of property along the line destined to become the extension of Montgomery street, were recorded on the 9th of February, and the aggregate amount paid for the different pieces of property included is $750,000. This movement is but the precursor of others that will be necessitated by the rapid expansion and business needs of San Francisco.

City Stocks.

The market for other than mining stocks shows an improvement, both in transactions and prices obtained. Considerable sales of Spring Valley Water were made during the week at $69@68 ₱ share. Gas stock realized $90; and California Steam Navigation Co. 65 per cent.

The Bank of California disbursed its usual monthly dividend on the 15th instant.

Mining Share Market.

The mining stock market has been characterized by a very fair degree of activity during the period under review, the aggregate transactions amounting to nearly as large a sum as the previous week, embracing large sales of prominent stocks. The Board list is being gradually extended under the influence which White Pine brings to bear upon the market, and in fact the interest taken in this new argentiferous region imparts more or less of the buoyancy the stock arena can boast of at this date. As to the developements on the Comstock lode, we cannot give very encouraging news; however, work is being prosecuted with the usual vigor—yes, we may say, with greater energy than for a long time past, and it is to be hoped success will crown the efforts of all. Owing to the heavy rains and consequent interruption of travel, we are debarred from giving the very latest information from the mines.

Alpha—declined from $59 50 to $51, closing at $56. The water has become quite troublesome in the shaft....Amanor (Cal.) sold at $255. The Badger drift has developed finely as they proceeded with it, and the north shaft, which is now carried a considerable distance below the lowest level, shows a fine vein.....Belcher has been less active than the previous week, declining from $33 50 to $28 50, and closing at $31. On the 10th inst. the ore at the south line, on the 200 level, was widening, and the quality improving. The ore found on the 335 level continues good, and assays of seventy-five tons raised through the Belcher shaft, show assays as follows: 335 level, $90; 200 level, $47. They are able to extract thirty tons per day from the drift. Water continues to trouble them in the 420 level.

Chollar-Potosi—sold within a range of $160 @166, then at $160, closing at $162. During the week ending February 5th, 1,217 tone of ore were extracted; previous week, 919. Receipts of bullion in January, $50,700, against $108,336 in December....Crown Point ruled at $67 50@69, and closed at $68 75. On the 7th inst. the main east drift, on the 1100 level, was in 58 feet; rock hard. The northeast drift, on the 900 level, had attained a distance of 42 feet east of the east clay, the face showing granite, and the south drift was 435 feet from the north boundary line, running in cement clay and porphyry. The stopes between the 800 and 900 levels are nearly exhausted. In January the bullion receipts amounted to $38,458; and in December, $35,720.

Gould & Curry—is quiet at a decline, closing at $105. Are engaged in repairing the shaft. ....Imperial declined from $142 50 to $125 50, and closed at $131. On the 10th inst. they had not yet reached the ledge on the 1000 level, being within about ten feet of it on either level. ....Kentuck opened at $206, improved to $230, and closed at $225. In January the receipts amounted to $83,335, against $98,582 in the month of December....Overman declined from $78 50 to $70 50, and at the close sold at $75. The January receipts of bullion foot up $36,000; in December they were $60,258....Savage declined from $66 50 to $60 50, and closed at $62 50. A dividend of $2 50 per share was paid on the 11th inst. The bullion receipts in January amounted to $176,700, against $152,000 in December.

Sierra Nevada—sold at $28@25. In January the bullion extracted amounted to $9,998 66; in December, $7,568....Empire changed hands at $100, seller 30. Receipts in January, $13,665; in December, $15,574.....Confidence ruled at $34@33. Bullion in January, $10,960; in December, $14,728....Yellow Jacket, under the change of twenty shares to the foot, sold at $79 50@73, closing at $76 ₱ share, equal to $1,520 ₱ foot. A dividend of $5 per share is payable on and after the 15th. F. F. Ohiston takes the place of W. W. Wattson as Secretary.....Hale & Norcross improved from $65 to $79, and closed at $78. They crossed the ore in the north drift, finding ore some five feet wide, and showing rather good assays. At a later date the news from the mine was less encouraging. An assessment of $5 per share was levied on the 12th inst....Golden Rule (Cal.) will pay its usual bi-monthly dividend on the 26th instant.

Coöperative Farming and Silk Manufacture.—Albert Brisbane, the well-known Fourierite, has bought a large tract of land in Kansas for a colony of Frenchmen, who will cultivate the land on the coöperative principle, and manufacture silk goods.

Physical Survey of Virginia.—A pamphlet of 90 pages, with three large maps, has recently been published in Richmond, Va., setting forth the geographical position, commercial advantages, and national importance of the Commonwealth of Virginia. It is entitled *Preliminary Report of the Physical Survey of Virginia.*

A Horticultural School for Women, similar to one said to exist in Germany, is proposed to be established by prominent Bostonians.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Water as a Poison.—To drink nothing but water in localities where it is notoriously deleterious, is madness. Such a course is not a rational temperance, but suicidal fanaticism. Even a change from one kind of water to another has an injurious tendency, though hoth may be tolerably wholesome. Qualify the draught in all such cases with Plantation Bitters, and no unpleasant consequences can possibly ensue. This agreeable vegetable tonic and antiseptic at once invigorates the stomach and neutralizes the effect of any poisonous or disturbing element that may exist in the spring or stream, or well, or pool, from which the fluid is taken.

Visitors in the city wishing spectacles or optical instruments for themselves or their friends, will do well to call at Muller's Spectacle Emporium, No. 205 Montgomery street.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Jan. 30th: Mr. Ray, the owner of that portion of the Mountain claim in Monitor district which lies on the slope of Red Hill, has made a commencement at showing what is beneath the surface. From the croppings in several places, Mr. Ray has recently taken rock which assays rich in silver and gold.

AMADOR COUNTY.

Jackson *Ledger*, Feb. 6th: Work on the Anaconda mine at Pine Grove is now being prosecuted with great vigor. The shaft is now down about 120 feet, and the deeper they get the richer it becomes.

The Alturas mine, located four miles above Volcano, is yielding very rich rock at the present time. They have now on the dump about 100 tons of quartz that will, in the estimation of good judges, pay $40 per ton.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, Feb. 6th: Calaveras has 491 miles of mining ditches. It stands third in the list of counties. There are 30 quartz mills in this county, which crush 20,000 tons of rock annually.

Business of every description is increasing in Railroad. Stores are being erected, quartz mills going up, and all branches of mechanical industry are flourishing. Discoveries of new leads are of almost daily occurrence.

A correspondent, evidently writing from Railroad Flat, says: The discovery of new leads in the immediate vicinity of the Flat, as well as in a circuit of several miles around, is of almost daily occurrence. Rich croppings almost invariably point to well defined leads, and those that have been the most thoroughly prospected are the most popular. It has been reported that the Chapman lead has been sold to a company for $15,000, the conditions of the sale being that the purchasers are to work the lead for three months, Chapman & Co. to receive the proceeds of their labor; after which time the lead is to be transferred to them, at the price above stated, if they desire it.

The Saudersou lead is undoubtedly rich, and only awaits the crushing process of its quartz, to satisfy the most fastidious. The Petticoat is a fixed fact; its good works praise it. The Chemisette and Balmoral have not been sufficiently prospected to arrive at a definite conclusion with regard to their richness, but the rock looks well and the leads seem well defined. Sandhorn & Lewis are working a new lead, running from near the South Fork of the Mokelumne, in a southwesterly direction. They have had very rich prospects. Opposite to them, commencing at Wet Gulch and running in the same direction towards Independence, and nearly parallel with the road, is the Good Hope lead, discovered and located by Alexander Piquette. The rock looks well and prospects favorably.

The Lower Rich Gulch correspondent writes: Work here is being pushed forward in good style. At the Palomo, they are sinking their main shaft. They have a fine, large vein, the rock of which looks well, showing considerable free gold. They will commence running the mill in a few days.

Alexander & Co. keep steadily at work, and seem to be doing a good business.

EL DORADO COUNTY.

Placerville *Democrat*, Feb. 6th: R. W. Scott, of Frenchtown, Mud Springs township, found a few days since in the Joe Goodwin claim, a specimen weighing 32 ozs., which is estimated to contain 20 ozs. of pure gold. The specimen is in shape precisely like a horned toad. The Joe Goodwin is an old claim, and one from which a large amount of money has been taken.

INYO COUNTY.

Los Angeles *Star*, Jan. 29th: We were shown this week, by F. Sabiche, two ingots of fine silver bullion from the Wolfskill & Cerveutes Mining Co., of Lone Pine, Owens River, Inyo County. One of the ingots weighed 87.86 ozs., and assayed .905 fine; the other was 85.50 ozs., .958 fine. We understand the mine is in fine working order, and that the ore is easily extracted and very free in working. The company has now at the beach 12 tons of freight, consigned to Tomlinson & Co., which consists of the various requisites for the successful working of the mine.

MARIPOSA COUNTY.

Gazette, Feb. 5th: The new quartz mill of Harbour, Williams & Co., near Buckingham Mountain, made an experimental run a few days since. It was the intention of the proprietors to crush 100 tons, but some portion of the machinery getting out of order they only completed the crushing of about 50 tons. Upon a cleaning up they found about seven pounds of amalgam.

NEVADA COUNTY.

Transcript, Feb. 2d: Stoakes & Co. commenced washing the dirt which they have taken out, and expected yesterday to put on more men, but were prevented by the snows which detained the water in the ditches. They are running for the main gravel channel, as are the parties working the old Kansas ground, and the indications are very favorable for striking it. The gravel increases in richness as they run into the hill, and there is every indication that they have the true lead. If these companies succeed, others will go to work, and a large range of rich ground in that locality will be worked.

Feb. 4th: Stidger, Evans & Co., at Buckeye Hill, have recently struck very rich ground in their claims, which they lately purchased from Henry Everett & Co.

The miners at French Corral are doing first rate, and have abundance of water. The Shady Creek claims are being worked. In the incline which is being run for a lower level, they have struck good pay. Coleman & Co., in the old Nebraska claims, have a 10-stamp mill for crushing their cement, and are doing well. The incline on the Kansas claim has reached very rich ground. French's and Giltman's claims have been sold to Chinese companies; the former getting $7,000 and the latter $10,000. Chinese companies have, during the past year, purchased a large extent of valuable mining ground on the ridge, which they are now working.

The Golden Age Co., on the south fork of Poor Man's Creek, commenced running their 10-stamp mill about 10 days ago, and the rock is looking splendidly. They are now running on the south end of the incline, which is down 125 ft. The ledge is 3½ ft. thick, shows some free gold, is very rich in sulphurets, and is regarded as one of the best ledges in county. Pat. Mulligan & Co. sold this ledge a short time since to S. D. Valentine & Co., of San Francisco, for the sum of $10,000.

Feb. 6th: The West Idaho Mining Co. have located 2,500 ft. on a ledge on the north side of Slate Creek, Rough and Ready township.

The Mount Bay Mining Co. have located 2,000 ft. on the Slate Creek ledge, adjoining Findley & Co's claim,

The Eureka Co. have located 17 claims of 60 ft. each on Relief Hill.

John Williams and others have located for mining and flumiug purposes, Sugar Cañon at Relief Hill.

Gazette, Feb. 3d: The mill of the Banner Co. which has recently been enlarged and improved was started in operation yesterday. The engine and machinery of the mill work beautifully, and it is calculated the mill will crush from 60 to 80 tons daily. They have out now some 600 tons of rock on which to commence crushing, and enough can easily be taken from the mine to keep the 40 stamps steadily at work.

Feb. 4th: J. J. Dorsey and others have located 1,000 ft. on the Eureka lode, commencing at the northerly boundary of the Roannaise claims, and being the second extension from the Eureka Co's claims. They also claim 150 ft. on each side of said lode, for dumps, casements, and other mining purposes.

Feb. 8th: The Sebastopol mill is now undergoing thorough repairs.

The proprietors of the William Penn mine east of Grass Valley, have let a contract to sink on the ledge to a depth of 100 ft. for the sum of $1,800. The claim has only been worked to a depth of 30 ft., and the rock has yielded as high as $30 per ton.

The owners of the Osborn Hill mine are pushing work ahead in their mine with energy. They have just placed upon the ground a new 8-inch pump. Several stringers on their claim give evidence of uniting with the main ledge, and they now anticipate finding it much wider than where they now have it. Gregory Co. adjoining, are sinking a shaft on the old Callahan claim, and taking out fine looking rock.

Grass Valley *National*, Feb. 1st: A. Shurtliff has located a claim near the Bowery ledge, which promises to be a very valuable one. He has found several fine specimens and the dirt prospects from one to two bits per pan.

Feb. 5th; Steam hoisting and pumping works have been erected upon the Garden City ledge. The ledge runs parallel with the street, dipping into Church Hill. They are now down about 50 ft. and are taking out some good looking rock. It shows galena, sulphurets, and some free gold. They will have a crushing shortly.

The John Bright ledge, near the Lone and Ben. Franklin is being well developed. They are down 200 ft. and have drifted on the ledge about 350 ft. The rock looks well and is continually improving. It pays from $35 to $50 per ton. Fifty loads just crushed at the Gold Hill mill yielded the sum of $1,954, an average of more than $39 per ton. The John Bright has never had a poor crushing yet, and is certainly a well paying ledge.

Truckee *Tribune*, Feb. 6th: We learn from J. E. Carter the following concerning the Mammoth ledge at Camp 22. The claim is known as the Mammoth ledge, and was first located by him in 1863. The location consisted of 1,800 ft. on the ledge commencing at the river shore. About $500 worth of work has been done on the claim and the ledge is quite wide. A sample of ore taken from a depth of about eight ft., assayed by Waters & Co., Sacramento, last month, gave $76 per ton in gold and $8.71 in silver. The rock is easily obtained, and being right on the river shore can be crushed by water power at a very trifling expense. Mr. Carter informs us that quite a number of quartz veins can he traced in that vicinity.

EXCELSIOR.—*Transcript*, Feb. 6th: From a letter just received from Meadow Lake, we learn that the snow is eight feet deep on a level, and at the time the latter left, it was still coming down, with no prospect of ever letting up.

Several of the mines in Meadow Lake district are being worked at present. The Mohawk & Montreal, Enterprise, and the White ledge are looking well. The former company is running their lower tunnel into their shafts, and will cut the ledge at the depth of 400 ft. from the surface. At the depth of 68 ft. they cut a blind ledge of excellent decomposed ore which looks first rate.

SAN BERNARDINO COUNTY.

Guardian, Jan. 30th: The Lytle Creek mines, if they were situated in the northern part of the State, would create as much excitement as any placer diggings that have been discovered in late years, but being in what is considered the grazing or agricultural district of California, they have not received that attention from miners and capitalists their richness deserves. From $5 to $20 per day to the hand is an average yield, and some of the claims on the Creek are paying much better.

SIERRA COUNTY.

Downieville *Messenger*, Feb. 6th: The Camptonville correspondent writes: For a week or so there has been considerable excitement about some rich quartz that has been found right in the town.

Since the road has been removed from the gravel diggings everybody has prophesied that the town would "go in," but as the Brush Creek mine has proved rich, and the Alaska ditto, and if we are so lucky as to have another right in the "city," we shall live and flourish sometime yet.

SISKIYOU COUNTY.

Yreka *Union*, Jan. 30th: This paper labors in a column and a half article to convince the citizens of that section that they ought to immediately combine and prospect and thoroughly work the flats adjacent to Yreka Creek, from Yreka City to its debouch into Shasta River. It says: Practical miners, whose opportunities have been the best for forming a correct opinion, have expressed the opinion, time and again, that it would pay largely if opened properly and worked to advantage. We may regard it as a well-established fact—as well established as any fact in mining can be prior to actual experiment—that the opening and working of Yreka Creek, if done in a proper and economical manner, would be a paying operation. That it will be done, sometime, we have not the shadow of a doubt. The question for the business men and property-holders of Yreka and vicinity to determine, is whether it shall be done now and they reap the advantage of it, or be postponed to the future and permitted to accrue to the advantage of those who succeed us.

A Scott Valley correspondent writes as follows: John Carroll & Co's claims on McAdam's Creek continue to pay well—pay nearly an ounce a day to the drifter. It will require many years to work out these claims. Why do our citizens go to White Pine when they can find on McAdams Creek plenty of diggings just as rich as Carrol & Co's claims. The Steamboat claims are as rich as any claims on the Creek. These claims will pay from half an ounce to an ounce to the drifter.

Col. E. P. Jenner, manager of the Ætna Mining Co., informs me that this company is working night and day with every prospect of soon reaping a rich reward for toil and money invested.

TULARE COUNTY.

Visalia *Delta*, Feb. 3d: From parties from White River we learn that mining operations are moving along as usual in that locality. Mr. Maltby is taking out of the Eclipse mine large quantities of exceedingly rich ore. The Philadelphia Co. are sinking upon and prospecting their mines.

TRINITY COUNTY.

Weaverville *Journal*, Jan. 30th: The claim of Ritter & Dack, on Lytle Creek, is paying them $100 per week. The claim is worked by means of a hydraulic, with water from Frey & Taylor's ditch.

The Weaver Creek flume is working finely, and the company have several men sluicing. Another year will be required to put the flume in the bedrock.

Frey & Taylor's new ditch out of Grass Valley Creek is in good condition, and is furnishing water to the miners on Lytle Creek.

Chamberlain & Worrell are prospecting on Rush Creek. They report that they have found good paying prospects. There is an abundance of good mining ground on Rush Creek that a little enterprise would develop.

ARIZONA.

Prescott *Miner*, Jan. 9th: The news from the various mining districts is good. Many men are preparing to go to Black Cañon diggings, Bradshaw district. Jackson, Lovejoy & Co. have commenced work in their hydraulic claims on Lower Lynx Creek, and Solomon Shoupe is opening another claim above them. The German companies at Big Bug, are sluicing away. Two or three men are in town, endeavoring to raise a party to go to the diggings on the south side of the Bradshaw Mountain. Mr. Borger is running his furnace and chlorination works at the Sterling.

Jan. 16th: The rush to the Black Cañon gold diggings, in the Bradshaw mining district, continues. Over thirty men left Prescott this week, and as many more are preparing to leave. By this time there must be a hundred men in the diggings, and there is room for ten times as many more. Although within six miles of the diggings there is an extensive pine forest, most of the miners that have gone there took lumber for sluices from Prescott. The winters are very mild at the diggings, and men can work there every day in the year.

There is lying in front of the store of Wormser & Co., a large, fine specimen of ore from the Sterling mine, near Prescott, and which Mr. Borger, the owner of the boulder, intends to take to San Francisco. It is nearly one solid mass of sulphurets, but strange to say, shows free gold in many places. It is, we think, the richest piece of sulphuret ore in America, and San Franciscans will say so when they see it. It was taken from the ledge at a depth of 60 feet.

Jackson, Lovejoy & Co. have commenced piping their hydraulic diggings on Lynx Creek, but unless it rains or snows soon, they will be compelled to stop work. The present is the dryest winter we have had since '63.

We learn by letter from Wickenburg, that Henry Wickenburg has sold his quartz mill to Kraus, Reed & Smith.

F. H. Wunderlich showed us this week a mass of Sterling gold, weighing 30 ozs., which was taken from the battery and off the plates, recently. It appeared to be very pure.

BRITISH COLUMBIA.

Portland *Oregonian*, Jan. 30th: Thos. Emery, now in this city, has received a letter from Geo. Weaver, who has a claim in the new diggings at Kooteuay. Weaver says the diggings are neither rich nor extensive, but that they will pay fair wages to a few. He would advise no person to come; but should there be a rush, he hopes it will not take place until after high water, about the 1st of July. He adds that there is a large section of unprospected country lying between Kootenay and Columbia rivers, where good diggings may be struck next season.

COLORADO.

Georgetown *Miner*, Jan. 27th: The Mendota lode is now carrying ten inches of solid mineral, and four feet of mineral and gangue combined. The quality of the ore is rapidly improving.

Huepeden, Wolters & Co., have taken out and shipped, since our last report, 3140.80 ounces of silver bullion, coin value $2,792.61.

The Grass Valley Co., of Colorado, have completed arrangements with Eastern parties for the erection of reduction works on the Grass Valley Bar, and propose to purchase ores from any that have them for sale.

The Marshall tunnel is now in 130 feet, and in close proximity to the Empire lode,

one of the best veins on Leavenworth Mountain.

The Griffith lode, on Griffith Mountain, is now carrying 30 inches of mineral, that assays 300 ounces of silver to the ton, and 30 per cent. of lead.

Denver *News*, Jan. 20th: Mining on the "Orphan Boy" lode, in the South Park, is being carried on vigorously, and fine ore is being taken out. There is but little snow in the Park.

MONTANA.

Helena *Post*, Jan. 15th: Hunter's Bar, in Confederate Gulch, is still being prospected by Thompson & Peterman. A tunnel has been run 200 ft. into the mountain, and at this depth exhibits seven ft. of fine wash gravel, averaging 12 cents to the pan.

From Argenta we learn that most of the mining operations have ceased for the winter. The Tootle, Leach & Co. furnace has closed up for the purpose of employing the full force upon the excavation of rock.

The Highland correspondent says that Pref. Swallow has just finished a trial run of 45 tons of ore from the J. B. Thomas lode with splendid results.

The Virginia *Democrat*, says: We learn that two runs have recently been made from the Iron Rod lode, which is down 250 ft. and upon which is three drifts. The first lot crushed averaged $122 to the ton; the second lot averaged $128 to the ton. It seems that they have struck the water level, as they take out from five to eight barrels of water per day from the shaft....A clean up at the Wann mill, in Rochester, which occupied two weeks, resulted in a yield of $3,000. The ore crushed was from the Watseka lode....The reports from Ramshorn Gulch are much more flattering than ever before. Detwiler & Co. are laying a drain and sinking a shaft to bedrock. Snyder & Co. are drifting and taking out most excellent results....Work has been recommenced on the John How tunnel.

Helena *Post*, Jan. 22d: It is reported that prospecting in the vicinity of Trinity revealed some rich placer diggings. We learn that the locality is being actively prospected with every evidence of success.

A person who has just arrived from Missoula Mills informs us that the people of that region are turning a little attention to quartz. There is a lode called the White Cloud, situated about two miles south of Missoula Mills, and ten miles from Fort Owen, which has been prospected quite extensively. A shaft has been sunk upon it to the depth of 80 feet, and the character of the quartz improves as the depth increases. J. T. Hervey, who erected a mill at Cable last season, is taking the mill down and proposes to erect it upon this lode.

Yesterday Prof. A. Steitz melted down 16 lumps of retort weighing 842 ounces. This retort was the product of a run of Prof. Swallow's mill, on quartz from the Thompson lode.

The Deer Lodge *Independent* gives the following: Prof. Swallow's mill at Highland, is at present crushing quartz from the Forest Queen lode, the richness of which is settled beyond all doubt....The St. Louis and Montana Mining Co. at Phillipsburg are taking out very rich ore from the Hope lode....The James Stuart mill will commence crushing ore about March 1st. John Ullery & Co. have found about half a mile east of the mill, at the depth of about 80 feet below the surface, a large vein of very rich ore, into which they are now engaged in running tunnels.....On the Boulder Fork of Flint Creek there is a number of miners engaged at work developing large lodes of argentiferous galena ore....In German Gulch the fluming company is very busy sawing blocks, etc., and getting ready for spring work....Some 74 men are still at work on the Siberia ditch, the tunnel for which was let on the 15th, at $4.25 per linear foot.

NEVADA.

REESE RIVER.

Austin *Reveille*, Feb. 1st: We learn from Palmetto district that Catherwood's 10-stamp mill was closed after producing $80,000 in two months. The cause of its shutting up was the exposed condition of the works at the Champion and Kentucky mines, from which the miners could not extract ore to advantage during the cold weather. When the mill was stopped there were perhaps 400 tons of good ore upon the dumps. The mill was worked successfully, and the mines which we have mentioned are said to develop large bodies of ore of a high grade. Work will be resumed in mill and mines with the return of favorable weather.

During the week ending Saturday, the 30th ult., the Manhattan mill in this city produced 15,617 ozs. of bullion. The ore reduced was of an unusually low grade.

Feb. 5th: There is a fine specimen of ore from the Buel North Star mine, in Lander Hill, to be seen at the assay office of Boalt & Stetefeldt in this city. It is a choice sample of the pure sulphuret ore which occurs in the noted mines of that hill, and would be an addition to the best cabinet of minerals. The face of the specimen exhibits white quartz, flesh-colored manganese, copper pyrites, and streaks and spots of blood-red ruby, beautifully blended. The ore is as valuable as it is beautiful, and would assay largely of silver to the ton.

Mountain *Champion*, Jan. 30th: The Silver Peak district is at present one of the liveliest mining camps in Eastern Nevada. The mill of the Great Salt Basin and Red Mountain Co. is hammering away night and day. The mine from which they obtain the ore now being worked is some seven or eight miles from the mill. The mine cannot be termed a ledge, for, as yet, neither foot nor hanging wall has been encountered; it is simply an immense quarry—a mountain—of gold-bearing quartz, which yields an average of from $30 to $40 per ton. The workmen have not to go down into deep shafts, with bad air, and work in a stooping or sitting posture as is the case in many of the mines in other districts, but work in the open air, and with a single blast throw down hundreds of tons of ore. The cost of mining the ore is said to be but $2 per ton; it cost $1.25 per ton to convey it to the mill, and the milling of it costs $5 per ton; making a total cost for mining, shipping and reducing the ore of $8.25 per ton, leaving a profit to the company of not less than $25 upon every ton of ore worked. The inexhaustible character of the mine and the facility with which the ore can be reduced—the mill putting through two tons to each stamp every 24 hours, and working the ore up to 95 per cent.—makes this one of the most valuable properties in the State.

WHITE PINE.

[The excitement concerning these mines seems to have somewhat lulled in the interior from the "fever heat," which recently characterized it; yet many persons from different portions of the State continue to wander thitherwards, and risk the chances of starving or freezing to death in order to be on hand at the first dawning of spring before the multitude which now stand ready to start on the first appearance of a thaw, can overrun and locate the entire region. The Austin *Reveille* in a recent article on these mines, characterizes the Eberhardt mine as the "fish-bait" which is leading many "suckers" to bite at many a well-concealed hook. It is true that numerous ledges have been located, and articles of incorporation filed on a vast number of what are called "leading mines," but the question is, how many of these locations have given any showing of producing a paying ore, and how many incorporated companies have been formed for the purpose of opening up and developing the lodges? It is easy enough to form a company and incorporate, and issue stock when a sufficient number of gullible persons can be found to invest in that kind of speculation, and we believe that the climate of California is very propitious for the production of this class of "hap-hazard" speculators. At least, judging from the past and present mining excitements, it would be hard to form any other opinion. It must be recollected that all mines are not Eberhardt or Keystone mines, even if they do lie within a thousand miles of those ledges, and inside of the boundary of White Pine mining district. That some of the companies are worthy of success we have no doubt, and we do not condemn White Pine for the wild-cat which always accompany new and valuable discoveries; but let the wise be cautious, investigate for themselves, or unite in employing reliable parties to examine for them before investing, unless they have plenty of cash to stake upon a venture.]—EDS. PRESS.

Stephen R. Hoyt writes from Treasure City, Nev., to the Nevada *Gazette*, under date of Feb. 1st, as follows: In my opinion, nearly all the ore found upon Treasure Hill lies in deposits, the mines having an accumulation of mineral matter of irregular shape. But few regular ledges or veins have as yet been discovered on the hill; the ore is found in stratas and lies horizontal. Several companies are now sinking shafts on Chloride Flat, expecting to find deposits of ore beneath the present stratas. It was currently reported on the streets a few days since that rich ore has been found in one of these shafts at a depth of 60 feet from the surface, but as yet the report has not been traced to any reliable source, and I think the rumor is not true.

A dispatch dated Elko, February 3d, has the following: Prospecting at White Pine district, which had gone on with the most satisfactory results until last week, is now stopped by the setting in of winter in earnest. The cold is intense, and the snow is from two to three feet deep and still storming. One foot fell on Saturday night. The stages are over-crowded, and the roads lined with people on foot, pressing forward for the new Eldorado. It is utter nonsense for people to rush there now.

Recent developments more than confirm the first impressions of the richness of the district. The Oasis and Miller's mills are now running at full capacity. The Eberhardt and Keystone consolidated yesterday, and will soon incorporate in San Francisco. Jumping lots and claims is lively. The Noonday and Emigrant companies, on Chloride Flat, ran into each other's tunnel on Saturday last, and a lawsuit or fight is imminent.

Austin *Reveille*, Feb. 1st: Ten bars of bullion, weighing 1,060 lbs., were brought into this city from White Pine by the stage which arrived this morning.

Feb. 4th: The deed of the Snow Drop claim at White Pine was sent to the Recorder's office yesterday for record. The claim was sold by E. Applegarth to the Chloride Flat Co. for $25,000.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Feb. 2d: The receipts of the Kentuck Mining Co. thus far on January account, aggregate $57,800.

The Sierra Nevada Mining Co. yesterday morning shipped through Wells, Fargo & Co. one sack of crude amalgam, valued at $4,000.

The Imperial Co. is hoisting about 140 tons of ore daily from the Alta mine, and both mills are kept running to their full capacity.

Feb. 4th: The Union Pacific Express Co. yesterday shipped 8,935 pounds of bullion, worth $24,823 25.

Feb. 5th: The Crown Point Co. are drifting on their 1,100-feet level, and expect to cut their lead in 150 feet. They are now in hard blasting rock, but have made 40 feet of the above mentioned distance.

Wells, Fargo & Co., yesterday, shipped 50 bars of bullion, weighing 3,851 pounds, and worth $91,858 44.

NEW MEXICO.

Santa Fe *Gazette*, Jan. 16th; A dispatch from Cimarron, dated Jan. 9th, says that Maxwell's mill cleaned up last night, after a week's run, $5,000 in gold, and the opinion is that the lode is better than ever.

The Elizabethtown (N. M.) correspondent of the Marysville *Appeal*, writing under date of Jan. 7th, after giving a history of mining operations in that locality says: The miners who had natural streams of water in their gulches—all of them too small to accomplish much—have been sluicing out good pay, and are very sanguine of large success when the ditch is completed next season. The main dependence of the country, however, is in its rich gold bearing lodes, many of which have been struck and a few very perfectly developed. They are very numerous, and run in a northeast and southeasterly direction, having for their base the prominent peak of a very high bare mountain, known as Old Baldy. The veins are wide, the quartz easily crushed, and containing what is termed fine gold. Maxwell's & Co's 15-stamp quartz mill is already in operation on the eastern side of Bald Mountain, and is cleaning up daily about $500, from the quartz of two lodes, discovered early in the summer. On Humbug Gulch, near Elizabethtown, an 8-stamp mill has been finished recently and is ready for custom quartz; a great deal of which has already been taken out of lodes by men as yet too poor to have mills of their own.

OREGON.

Portland *Oregonian*, Jan. 30th: Specimens of gold-bearing quartz from Burnt river, said to be worth $2,000 per ton, have been recently brought to this city.

WYOMING.

Sweetwater *Mines*, Jan. 23d: The South Pass correspondent writes: The new ledges discovered in the fall and this winter are now undergoing development. The Duncan ledge, discovered in the fall, has a character of rock resembling the Jim Dyer and Cariso; the Golden Gate is similar to the Duncan; the Barnaby is another of the Cariso character; the Empire and Nellie Morgan, on Palmetto Gulch, are of the same stripe. All these ledges exhibit free gold and assay well—miners' process; hand-mortar and horn. Now we come to another character of quartz, but equally as rich as those just mentioned; it is after the nature of the Lone Star quartz, exhibiting little or no free gold, but prospecting well in flour gold; such as the St. Lawrence ledge, of recent discovery. I have examined this ledge attentively and with curiosity. I see in it the solution of a mistake that was made by the many wise-acres that rushed here last spring and as speedily left. They claimed that in this country the ledges must prospect on top, or they were worthless. The discovery and development of the St. Lawrence has exploded this idea. Not a color could be got on the surface, and not until the depth of six ft. was reached could a prospect be raised; from that to the depth of 24 ft. it proves rich, and is increasing in value as they go down.

SILVER PRODUCT IN COLORADO.—The year 1868 shows an increase in the production of silver in Colorado, over 1867, and improvement in the methods of mining and beneficiating ores. The following are the products of leading metallurgical establishments in the vicinity of Georgetown, as given by the Colorado *Miner:*

Huepeden, Wolters & Co., (amalgamation) in eight months' time, 38,046.28 ounces—$30,101.15.

Georgetown Smelting Works, managed by Mr. Herriek, 19,800 ounces—$26,730.

Schirmer & Bruckner, (smelting) in five weeks' time, with Kustel furnace, 8,312 ounces—$11,214.20; being 96¼ per cent. of the fire assay of ores treated.

Stewart's Smelting and Amalgamating Works, in fifty working days, 5,218.50 ounces—$5,939.

Brown Company, at their own works and at the Georgetown Smelting Works, during the year, 6,480 ounces—$8,748.

Total for 1868, about $100,000; against $18,000 for 1867.

LOCHHEAD'S NEW TWIN PROPELLER for Goodall & Nelson's tug-boat, is so planned that instead of having a separate engine for each propeller, as is usual, one engine will turn both propeller shafts, by direct action, without the intervention of slides and gibs. The two propellers are revolved right and left, together, at the same speed always; and the reverse, by a link motion, turns the propellers the other way. One propeller cannot be turned ahead and the other reversed, as in ordinary twin propellers. Another novel feature in this engine is the fact that the two propellers, working as they do, right and left, are placed further aft than usual with twin propellers, and the blades, three in number, run into each other like the teeth of a gear-wheel. To keep the two shafts working at the same speed, and so that there may be no strain on the beam, they are geared together with four gears abaft the engine.

ACCLIMATIZING GROUSE.—Messrs. Liddle & Co. have recently imported six pairs of grouse from the northern part of Oregon, with the intention of introducing them into the counties bordering on San Francisco. The bird was introduced into the northern part of Sonoma County some years since, and has done well. Some few of the birds were placed in Marin County, but owing to the facility with which hunters have been enabled to scour that county, they soon disappeared.

AMERICAN ARMY GUN.—The United States has adopted, as the national arm, the Allin breech-loader, which is produced at the Springfield United States Armory by transforming the ordinary Springfield regulation musket into a breech-loader. It is said to do more execution than any other gun known, and combines more essentials for general efficiency. This gun is named after its inventor, Mr. Allin, the Master Armorer at Springfield.

HOW THE BOTTOM OF THE OCEAN IS INHABITED.—In a recent report before the Royal Society, Mr. Gwin Jeffreys stated that deep sea bottoms teem with animal life, and with creatures of a very remarkable kind, some of which connect long past geological periods with the geological action going on in our own time. In an exploration made recently, the dredge brought from a depth of 517 fathoms a crab, an ophiurian and some other annelides.

NEW DREDGING MACHINE.—W. K. Reed of Stockton has contrived a dredging machine, which is simple in construction and is capable of performing a large amount of work. On an average, it requires about two minutes to cast the scoop into the water, take it up full and empty the contents into the barge. Three men only are required to operate the apparatus. The barge will carry a burden of eighty tons, and can easily be loaded in a day.

INDIA RUBBER TIRE AND HORSE SHOE COVERS.—It is proposed in England and France to render pavements indestructible by the use of india rubber or gutta percha tire and horseshoe coverings. "No more racket in the streets," advertises the inventor.

MINING AND SCIENTIFIC PRESS.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

A. B. BUTLER, California, agent and correspondent.
WM. H. MURRAY, California.
DR. L. G. YATES, California.
S. H. HERRING, California and Nevada.
T. G. ANDERSON, Nevada.

Resident Agents.

OAKLAND.—W. B. Hardy.
A. S. Hopkins, No. 70 J street, Sacramento.
WHITE PINE DISTRICT.—Alexander Bruckman, Hamilton, Nevada.
HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

MR. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:

Saturday Morning, Feb. 13, 1869.

Notices to Correspondents.

A. Z.—The interesting crystallization of epsom salts dissolved in beer when spread upon glass, is no new discovery, as asserted by some cotemporaries. It was named to us by a gentleman when we first took possession of our present premises, as being one commonly adopted as a cheap mode of *frosting* window panes, and recommended us to make a trial of the method with the lower portion of the glazed partition of our inner office. As some interest appears to have sprung up on the subject, we intend to do so, and after the end of the present week, those who may be desirous of seeing the effect produced, may witness it by calling. We are informed it was employed at a store in this city ten years ago; and it has been stated to us by an English sexagenarian, that this mode of frosting windows has been practiced in England beyond the period of his earliest recollection.

ADHESION between liquids, retaining the form of liquids, is usually very perfect, as from the mobility of the particles they easily become incorporated. Some of the greatest exceptions are to be witnessed, as in the instance of oil and water. A drop of vinegar, ink, or alcohol, may be perfectly mixed with a quart or any other quantity of water,—a drop of water,—with a quart of vinegar, ink, or alcohol. To the instances given of perfect adhesion and also of non-adhesion, may be added a few in which at a certain point, the adhesion of the particles of the two liquids balance their adhesion towards each other, and become mutually saturated. Ether may, by agitation, be mixed with water, and the greater part will separate on allowing the mixture to repose. The ether will have dissolved one-eighth or one-tenth of its bulk of water, and the water will have taken off about an equal quantity of ether. In a similar manner, the essential oils dissolve to only a very small amount in water; oil of peppermint, for instance, if agitated with water, and then left to rest, will, for the most part, separate, although a sufficient quantity will become dissolved to communicate the flavor and odor of the essence to the water.

THE REPORT OF LIST OF PATENTS for the Pacific Coast has not been received this week, owing probably to detention of Overland Mails.

THE Pacific Theological Seminary, under Prof. J. A. Benton, is open for students. President, A. L. Stone; trustees, J. A. Benton, Noah Brooks, and J. M. Haven.

Our Resources—A Noble Field.

Who that reads our newspapers, or travels on the Pacific slope, or thinks, can fail to conclude, in his own mind, that this country is the noblest field for energetic men, and for the development of a powerful cosmopolitan race, that the world has ever seen? Yet we are so habituated to self glorification, and our favorable situation has so often been asserted, that the repetition seems but stale. It is nevertheless a living truth that may well inspire us, and that cannot fail to excite every free and clear-sighted observer in our midst to enthusiasm. Our resources are, to our present means of estimating them, absolutely boundless. The opportunities presenting themselves to individuals for advancement in material prosperity and in the enjoyment of life, are found to exist everywhere, so that the honest man who fails to profit by them must be adversely constituted, or short-sighted and tbriftless indeed. It is quite needless to specify; every one can refer in his own mind to half a dozen openings for enterprises such as would be in grandeur almost beyond the grasp of the detailed schemers and capitalists of over-populated older countries.

The Pacific Coast has been occupied by us for twenty years, and we are scarcely beginning to realize its extent; none but the shrewdest and studiously observant have more than a very partial idea of its resources. To this day there are territories virtually unexplored, and unapprcciated, that would suffice to make States and empires.

Thus White Pine suddenly looms up before us out of the wilderness. It is now ascertained to be undoubtedly the deposit of thousands of tons of accessible *metal*, which will be circulating in the form of silver currency in perhaps a little more than two years of time. From what we know of the extent and nature of the chloride and rich vein deposits of Treasure Hill and vicinity, it is pretty certain that they cannot be exhausted in less than two years, nor the ores worked up by all the stamp mills that are likely to be brought into use on the spot within that time. Business men, manufacturers, ranchers, and home-staying Californians, may calculate accordingly. Beyond that, the probability is that not only Treasure Hill, but Virginia City and Austin, will remain permanently profitable mining centers, without the romance of "early times" however, but under the world's stern law of realities, in the same manner somewhat that California mining is permanent to-day.

White Pine is but a single item. The entire Pacific Coast is as promising as it can be. To realize the truth fully in detail, all that is necessary is information; a desideratum that, we are proud to state, is appreciated by a larger proportion of laboring men —who are in most cases of respectable family antecedents—than in any other country, or amongst any other race that the world ever produced. In confirmation of the above statement, let the reader glance over our column of "Resources and Developments," consisting of items clipped chiefly from our San Francisco daily exchanges in a single week.

This is not merely a noble land, but it is filling up with a brave and generous people. To be narrow-minded and small-souled is as bad in California if not worse than it is to be "no gentleman." It is true that lately we are having garroters and thieves; they circulate in our midst and travel in our public conveyances, but they wear foreign-looking clothing, and are not of us; and they soon become highwaymen, gamblers, pimps, etc., ashamed in a land like this of being anything more thoroughly contemptible.

We have grand mountains, and blue hills which smile in peaceful sunlight under the most joyous of skies, and love to outline themselves clearly against rosy and golden sunsets; we have rich valleys, prolific in growing all the fruits of the tropics that we can desire,—oranges, figs and vines. As society, we are toned in manly, adventurous antecedents; and are without exception latently conscious of our destined greatness, though disposed in a human way to overlook the significance of the present. Without attempting to study general bearings that do not concern the multitude, we may rest complacently in the satisfaction whose absence so distressed Alexander, that there is presented, on the Pacific Coast, to each individual a "world to conquer," of a magnitude sufficient to satisfy every ambition.

A MILLION BUFFALOES ON THE RAILROAD. We had begun to think that the buffaloes would not be seen any longer where the railroad has been built; but a gentleman just arrived from the plains reports that at a distance of 250 miles west of the Missouri, on the Kansas Pacific road, he passed through a herd covering a surface of 500 square miles, and containing probably over a million. The number of dead buffaloes lying on the line of the road, shot by passengers as the cars go along, is very great. Legislation must surely put a stop soon to such wanton slaughter. Though there would seem to be no danger, from this, of buffaloes becoming extinct at an early day, yet it is a fact worth knowing in evidence of such a possibility—in spite of their vast numbers—that similar species of wild hoofed animals which herded in great numbers in Central Europe in the ancient pagan times, are now entirely extinct, not a representative of their kind being left on the face of the globe.

THE SCHOOLMATE.—This pleasing and instructive monthly continues to supply a quality of useful and interesting reading matter such as is adapted to and required by the young students of the land. It is the oldest boys and girls' magazine having a general circulation, and is not inferior to anything of the kind that has ever appeared. Artistic illustrations much enhance its value. It is published by Joseph H. Allen, No. 203 Washington street, Boston, at $1.50 per annum.

NOTHING NEW.—John Cox made a velocipede sixty years ago, exactly like the two-wheeled one which is now the rage. He handled it as well, too, as the best of Parisian experts; astonishing the natives of Norwich, Connecticut, with the rapidity and grace of his evolutions. He was a blacksmith,—born to blush unseen in the wilderness of a Yankee town. The same idea occurred, half a century later, to somebody in the gay French capital, and his fortune was made.

SALE OF THE HIDDEN TREASURE. —A sale of this valuable mining property was effected on Thursday last for $200,000. The stock, we are informed, is already commanding a high advance. The new Directors are: George W. Beaver, President; E. B. Dorsey, George D. Roberts, S. Haydenfeldt, Frederick Castle, M. J. McDonald, Robert E. Morrow, Directors.

A NEW STYLE VELOCIPEDE.—Messrs. Perkins & Detrick have just completed a three-wheel velocipede on a new principle. Each of the rear wheels work independently by means of a clutch, by which the operator can give a long or short stroke to either treadle. It made its first appearance last evening, and works with great ease. A splendid thing to all appearances. We shall mention it more fully hereafter.

AN EXAMPLE TO BE FOLLOWED.—A microscopic club has been organized in Chicago. Two well-known citizens express a willingness to give liberally toward purchasing instruments and scientific works upon the subject of microscopic instruments.

VELOCITY OF NERVE FORCE.—It takes about a second for the prick of a harpoon in a whale's tail to reach the sensorium; and another second for the telegram, which is sent back to the tail to capsize the boat, to get there. This is generally time enough for the boat's crew to "pull off" to a safe distance. Helmholtz found, by experiment with Pouillet's chronoscope,—a machine in which a magnetic needle is made to deviate more or less by a galvanic current of longer or shorter duration, thereby measuring time in thousandths of a second,—that the velocity of the nerve force was about eighty-eight feet in a second. M. Hirsch, of the Neufchatel Observatory, found that in man it was about 111 feet in a second. Dr. Schelske found it about ninety-six feet. The following is from the *Journal of Mental Science:* "The time required for certain cerebral operations has been measured by Dr. De Jaager in the following manner: It was preconcerted that the person on whom the experiment was made should touch the lever of the chronoscope with his right hand when he received an electric shock on the right side, and with the left hand when he received a shock on that side. The interval between the shock and the signal was found to be 0.20 of a second when the subject of a experiment had been told beforehand on which side the shock would be given, and 0.27 of a second when he had not been told; 0.27 had therefore been employed in reflection.

"M. Hirsch, again, has found that on an average two-tenths of a second must elapse before an observer can mark by a signal his perception of a sudden noise or flash of light, and MM. Donders and De Jaager have varied their experiments thus—one of them pronounced a syllable, the other repeated it as soon as heard; when the syllable had been agreed upon beforehand, there was an average delay of two-tenths of a second; when it had not been so agreed upon, of three-tenths of a second. These are, however, only average results, and subject to considerable individual variations."

STEAM STREET CARS WITHOUT FIRE.—A Philadelphia plan which has lately been reduced to experiment, is to supply a locomotive with water heated to a high temperature in a stationary boiler, and forced into a tank attached to the said locomotive. The engine weighs about five tons when ready for work. At the trial it ran forty-five minutes. No noise was heard except the rumbling of the wheels. It was under perfect control. The temperature of the water in the tank is kept up by a non-conducting jacket three inches thick.

PARTING OF GOLD AND SILVER IN THE MINTS.—A movement to procure the exclusion of refining from the operation of the Mint and its branches, has been renewed in both branches of Congress. In the Senate Mr. Stewart, and in the House Mr. Kelly, have introduced bills authorizing the Superintendent of the Mint to exchange unparted for refined bullion with private refining establishments, in whose interest the same proposition has been twice heretofore put forward without success.

VELOCIPEDISTS are using the pavilion of the State Agricultural Society at Sacramento, as a tournament ground, in the presence of numerous spectators.

The Virginia City *Enterprise*, in mentioning practicings on the velocipede at Armory Hall, in that city, says: "Sanguine parties here are already talking of getting up a steam velocipede. The engine will be of brass, and the whole vehicle is to weigh less than 300 pounds.

A Lyonese velocipedist offers to bet any amount that he will beat the fastest trotter in a race.

PRISMATIC GUNPOWDER.—The Prussians have decided on the adoption of prismatic gunpowder for cannon, of a specific gravity of about 1.66.

GOLD CRYSTALS.—At F. Reichling's assay office, No. 334 Montgomery street, may be seen some very perfect Californian and Australian gold crystals, the forms of which are quite dissimilar. Gold crystallizes always in the regular, or tesseral system, characterized by having all the axes of diameter of a crystal equal. The usual and most characteristic form of crystallized gold, in California especially, is the octohedron; a frequent variation is the rhombic dodecahedron, in which but one of the rhombic sides is developed. A very fine breastpin at Richlings, consisting of a group of crystals, from Martinez Creek, in El Dorado County, represents the Californian characteristics. The Australian specimen is a well developed solid dodecahedron of larger size than is common for anything else than octohedrons, and is partially encased at one end in quartz. The Australian crystal is for sale, for a little more than the value of the gold it contains.

THE CHINESE METHOD OF VICCINATING. Dr. Offo, a Chinese physician residing in Oakland, was asked by a scientific gentleman with whom he was conversing on the Oakland boat: "Do you vaccinate in China?" The reply was, "Not like the Americans." "How do you do it?" "Oh, we put it in the nose (making a motion like that of taking snuff), and then comes the fever—all over." "How long is it since they commenced practising that in China?" "Oh, long, *long* ago," (gesticulating). It is stated in the daily papers that very few of the Chinese have died of small-pox in this city.

FIRE-HOSE BRIDGE.—As street railroad cars are frequently stopped in the vicinity of fires, by the hose lying across the track supplying the engine with water, Mr. A. W. Taylor, of Brooklyn, N. Y., (Box No. 139) has invented a convenient bridge which may be carried along on the front platform by the driver, and by which means the car is enabled to continue on its course without injury to the hose. The machine is of iron, is of very simple construction, and can be fastened to the track so firmly that a car is in no danger of being thrown off, or of misplacing the bridge.

DELICATE GLASS FABRICS.—De Brunfaut, in Paris, recently exhibited articles made of spun glass, such as head-dresses, watch chains, curled and smooth ostrich feathers, etc. The usual objection to glass fabrics of brittleness does not apply here, as the thread is as fine as a spider's web. It is not inferior in strength to the best wool, while far exceeding it in beauty. The flexibility of the thread is such that it may be worked in the sewing machine.

THE GRAND EXCURSION ROUND THE WORLD will cost, from New York to San Francisco, by the Pacific Railroad, $150,—time, six days; by the China steamships, from San Francisco to Honkong, and thence to Point de Galle, (Ceylou,) $620—time, forty-four days; thence to Paris via the Red Sea and Mediterranean, $650—time, twenty-five days; and across the Atlantic, $125; total, $1,550, all in currency; total time of traveling, eighty-five to ninety days.

MAYNE REID'S MAGAZINE, "ONWARD."—The February number of this new periodical, dedicated to the youth of America, is a very attractive publication. It is of itself a small volume (180 pages), and is filled with stories, of "magazine size," and illustrations, in which the life-like and telling character,—in short all the good traits of Mayne Reid's books,—are well maintained.

"GLYCONIM" is the name of a substance newly invented by the doctors for protecting wounds. It covers them with a kind of varnish, which protects them from the air, and is made by adding five parts of glycerine to four of yolk of eggs. The mixture has the consistency of honey, has a salve-like feeling, and is unaltered by exposure to air.

TO AFFECT chemical combination, it is generally requsite that one of the bodies shall be in the liquid or gaseous form, and if such is not the case at ordinary temperatures, they have to be produced by the elevation of the latter. Hence the old rule, "*Corpora non agent nisi fluida*," under the erroneous supposition that the fluid or *menstruum* was the only active body, and the solid or *solvendum* a resistance to be overcome. Solid bodies either do not combine at all, or their combination is attended with great difficulty, because from the immobility of their particles, their points of immediate contact are but few, and the exceedingly thin film of compound which may be formed at such points, acts as a partition to prevent further contact, and consequently hinders combination.

EXPLORATION OF ALASKA FIORDS AND RIVERS.—The "Youkon," a flat-bottomed boat, suitable for towing, 50x11 feet, and drawing fifteen inches water when loaded, has recently been built at North Beach, by George Gates, for Capt. R. H. Waterman, to be used in ascending the shallow streams along the coast of Alaska. In general appearance she resembles the two stern-wheel steamers built a few years since for the Russian-American Telegraph Co. She will be taken apart and conveyed to her destination on board a sailing vessel, under the charge of Mr. W. H. Ennis, who is familiar with the streams to be navigated, and the management of boats similarly constructed.

EVAN'S CORRUGATED RIFFLE, to save amalgam from the battery, appears to be meeting with approval, judging from the favorable notices it is receiving from the press and from miners. Some specimens of sand tailings caught by the riffle that otherwise would have passed away, very thickly speckled with quicksilver and amalgam, are shown at S. P. Taylor's store, underneath the MINING AND SCIENTIFIC PRESS office. Riffles extending 30 to 50 feet are claimed to be more efficient than even a much greater length of blankets.

FREIGHT TO WHITE PINE VIA COLORADO RIVER.—Light draught steamers can go up to Colville on the Colorado, whence there is a good level wagon road of about two hundred miles to White Pine; a distance less than twice as far as from Elko to White Pine. The stern-wheel steamer Chin-du-Wan, built at Stockton, last summer, is intended for the navigation of the Colorado river, whither she will proceed in the spring, via the Gulf of California, and it is thought that considerable freight will be conveyed by this route during the summer season to the newly discovered silver region.

NO MEANS have yet been devised of combining the nitrogen (which constitutes 80 per cent. of the atmosphere) with hydrogen, so as to form ammonia. By heat and electricity this union has been attempted without success; but if tin-foilings are placed in contact with water and binoxide of nitrogen, the tin will absorb the oxygen of the two last named substances, while the hydrogen will at the moment of liberation from the water, combine with the nitrogen set free from the nitric oxide, and form ammonia.

THE SUN'S HEAT is transmitted to the earth by radiation; some idea of the amount of which may be gleaned from a rough calculation made by Farraday, to the effect that the average amount of heat radiated on a summer's day upon an area of land in the latitude of London (52°) amounts to as much as would be emitted by the combustion of 240 bushels of coal.

REMARKABLY HIGH TIDES.—The waves at the Ocean Side House swept up to a distance of at least fifty feet beyond the ordinary high tide limit, damaging the road at the Ocean House, and at the Seal Rock House.

FOOT HILL DIAMOND CRYSTALLIZED.—A beautiful specimen of a diamond crystal about a quarter of an inch in diameter, has been on exhibition for some time past in the shop window of Mr. Shreve, the jeweler, on Montgomery street. It is from a locality in Nevada County, where a number of fine crystals of greater size and purity than this have been found heretofore by the same party, all of which have gone into the possession of connoiseurs.

INSTANTANEOUS PHOTOGRAPHY.—It is said that Fox Talbot placed a hand-bill on a wheel revolving two hundred times a second, before a camera. By the light of a single electric spark a perfect and legible copy of the bill was made. Bromide of silver was used in this case instead of the iodide. A marching regiment of soldiers, or a waterfall, may be taken by means of the same agent.

SHIPPING BULLION OVERLAND.—We are informed by reliable authority that several parties interested in mining claims in the White Pine District are making arrangements to ship all their bullion direct to the East from that locality; and that such shipments will be made before the overland railroad is completed.—*Times.*

"THE EL DORADO" is the name of a new eight-page weekly, published by the Ladies' Coöperative Union. All the work is done by female compositors, at No. 517 Clay street.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

DEWEY & CO.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M. TAYLOR, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco 6v18-3im

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

ACROSTIC.

Pain Killer is *worth* what it weighs, in gold,
All around the world are its praises told;
It will Cholera cure—scourge of southern climes,
No victim dies, who takes it betimes.
Keep Pain Killer—a true friend by your side,
It will cure Cough or Cold, or Colic beside;
Look out to apply it for Bruise or for Sprain,
Let it once be tried—"*twill be used again;*
Every word I am telling you, Reader, is true;
Remember that Pain Killer is *good for you.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.
REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. feblm

$20,000 to $25,000.

A PRACTICAL SMELTER wishes to enlist capital to build a Furnace on a Mine of rich Argentiferous Galena at White Pine. From $800 to $1,000 a day can be cleared with ease. Security and best of references, etc., given.

DROP LETTERS.—It should be distinctly understood that drop letters, when sealed, require but ONE CENT postage in towns or cities where there is no free delivery by carriers.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

Constitution and By-Laws
—FOR—
Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the
Mining and Scientific Press.
Orders from the interior faithfully attended to.

Resources and Developments.

COL. LARRABEE has imported a lot of bamboo plants from China, which he thinks will grow at Los Angeles.

SILK IN THE FOOT-HILLS. — Nevada County has 50,000 mulberry trees, being the only mining county that has made a commencement in the silk business.

SILK REELING.—Fifty Chinese families, well versed in silk reeling, have been sent for by the filature about to be established at Los Angeles. Cocoon growers will find ready sale for all they can raise.

UMPQUA VALLEY OUTLET.— The new road now building from Umpqua Valley to Coos Bay, will bring that valley within forty miles of tide water and the numerous vessels in the San Francisco lumber and coal trade of Douglas County, Oregon.

WOOLEN MILL AT CHICO. — The Chico *Courant* urges the erection of a woolen mill, or the transformation of Gen. Bidwell's large brick building at that place, into an establishment of the kind, to be carried on by a joint stock company of farmers and sheep raisers, in shares of $50.

WOOLEN FACTORIES IN OREGON.—Parties are endeavoring to obtain water-power at Eugene City,—says the *Journal*,—to put up a woolen factory, to cost $90,000. The Ellendale Woolen Factory is in active operation. The factory at Brownsville is still closed.

A FIG ORCHARD to contain a thousand trees of the large purple Smyrna variety is being planted at Mormon Island, Sacramento County. The figtrees exceedingly well in the foothills, to an elevation of 1,000 feet. Domestic dried figs sell readily at twenty-five cents per pound, retail. They will soon be produced in large quantities for exportation.

A GREAT VINEYARD.—The Buena Vista Vinicultural Association has 290,232 vines set out in vineyard, covering 426¼ acres, or an average of 680 vines to the acre; from which last year 96,000 gallons of wine were made. This is,—says the *Alta*,—the largest vineyard, or, at least, wine-growing estate in the world, though not the most profitable.

OYSTERS FROM MEXICO.—The steamship *John L. Stephens* brought up, consigned to the Mexican Oyster Company, a supply of toothsome bivalves in good order, the first shipment this season. They resemble the Harlem River oysters more than any other on the Atlantic side. Three of them fill a big plate. Next season this company will be able to supply the whole coast from their beds in Mexico, the location of which is kept a secret. They are brought in tanks of water from Mazatlan.—*Times*.

WOOLEN MILL AT SANTA ROSA.—A meeting of the citizens of Santa Rosa, Sonoma County, was held on Wednesday, February 4th, to consider the proposition of building a woolen mill there. Estimated cost $30,000. The subject was discussed at the meeting, and steps were taken to forward the object in view. Energy and liberality among our business men and capitalists,—says the *Democrat*,—would add at least a thousand persons to the population of Santa Rosa within a year.

LOCAL RAILROADING.—The monthly receipts on the San José and Santa Clara Railroad average $1,000, and are expected next summer to double that amount. The owners of the road are discussing the question of substituting cars driven by steam-power similar to those of a company in Brooklyn. The fuel used in these is petroleum, a jet of which is thrown by every revolution of the car wheels, upon a small quantity of burning coal, which serves as a kind of wick. The time would be reduced to twenty minutes—about half of that now occupied.

SOUTH SAN FRANCISCO.—At a meeting of the representatives of the South San Francisco Dock, and of the Bay View Railroad companies, etc., held on Monday evening, it was stated that the cost of clearing out the Potrero Cut sufficiently wide to lay a double track, and of placing on the line a sufficient number of cars and horses, would be about $150,000. If trips be made every fifteen minutes, and only one fare charged from the foot of Fourth street to Bay View, the Dock Company will pay $25,000, and other associations and property-owners in that vicinity contributing in the same proportion, it is thought will swell the amount to $75,000. A number of manufacturing establishments, and quite a little village, have grown up in that vicinity. Boiler works will be established in South San Francisco by Messrs. Tevis & Risdon.

WOOL GROWING IN THE FOOTHILLS. — As lands in California are becoming rapidly settled, sheep ranges are becoming scarce.

Nowhere can better ranges be found, says the Folsom *Telegraph*, than in the foothills. The mild climate, shelter and good feed is unequaled all the year round. Parties purchasing five or six quarter sections of land, and starting with four or five hundred head of sheep, can have a nice little fortune in four or five years. The rapid increase in the annual clip of wool, now 42-fold what it was thirteen years ago, shows that sheep farming is a profitable business to all concerned. According to these figures, the man who, in 1855, had 100 ewes, should have now 4,200 sheep. Besides this increase of his principal, he has enjoyed an annual income from his wool.

MORE PETROLEUM DISCOVERED IN MEXICO. Lately petroleum has been discovered on the Pacific shore of Southern Mexico, near Port Angel, in latitude 15° 38' north, distant southeast 180 miles from Acapulco. Oil is obtained from four springs, and the formation is said to be sandstone, lying horizontally over shale. In two of the wells excavations have been made with crowbars; at a depth of about 16 feet the oil began to run out so fast that the men could not work in the holes, and not only did the oil run faster as the diggers went down, but it came lighter and thinner. Vessels can at all times anchor safely in Port Angel, from whence there is a good road to Oaxaca, the capital of the State, on to Puebla and Mexico. Native labor is 50 cents per day, without board, and may be depended upon.

NUT GROWING.—The planting of nut-bearing trees, looked at from a financial point of view, is thought to be worthy of deliberate consideration, as the demand for nuts is beyond home supply, and if already and remunnerative market cannot be obtained at one's door, the nuts will bear shipment and keeping. The streets in towns and roads throughout the country could be set out with nut-bearing trees at slight expense, no loss of soil, and with profit to the owners of land contignous to the thoroughfares. The chestnut, butternut, hickory, almond, English walnut and black walnut, where the climate will admit and soil justify, are all beautiful shade-ornamental trees. They can be transplanted while young with a loss not to exceed ten per cent.; grow rapidly, and come into bearing usually from the seventh to the tenth year from seed.

THE GREAT INTERIOR.—Of the inexhaustible mineral resources of the vast basin rimmed by the Sierra and Rocky mountains,—says the Sacramento *Union*,—no doubt remains. But this great interior, now silent and treeless, has a greater capacity for agriculture than many suspect. C. W. Dilke notes the resemblance in many respects to similar situations in Algeria and Australia, and predicts that here, as there, even the deserts may be made to bloom. The sage brush is seen to be gradually encroaching upon the sands. All that is needed, he believes, is irrigation; and this may be obtained by means of artesian wells, flowing of themselves or operated by windmills; or by means of dams and reservoirs, economizing the melted snows of the mountains, as in Algeria. Even the alkali plains may, he believes, be thus redeemed; for in Algeria it has been found by the French farmers "that under irrigation, the more alkali the better the corn crop." The process of desert reclamation will therefore be, first, irrigation; second, planting of fruit trees, corn, vines, and other plants which shade the soil; then, with increasing moistnre, other products may be introdnced.

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE
Declared by connoisseurs to be the only
GOOD SAUCE.
The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for
Lea & Perrins' Sauce,
and see that their names are upon the wrapper, labels, stopper, and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.
Caution against Fraud.
Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.
Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO. San Francisco. 3v18 1y

HINKLE'S
"IMPROVED SPRING-BED BOTTOM."
(Patented July 21st, 1868.
The undersigned, having purchased the Patentee's interest in the States and Territories of the Pacific Coast, is now prepared to supply Private Houses, Hotels and Steamers with this comfortable, economical and durable "IMPROVED SPRING BED BOTTOM."
Persons going to White Pine will greatly promote their comfort by taking one of these Patent Bottoms, which is secured to a folding Bedstead, the cost of which is less than that of the materials at White Pine.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the per ection of Prepared Cocoa, that it has not only secured the preference of home baths and cocoa drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied
All communications must be addressed to

MINERAL LANDS VS. RAILROAD GRANTS.—It seems, according to the Sacramento *Bee*, that the recent test suit in the Placer County District Court, between the Central Pacific Railroad Company and miners and ditchmen along the road, has been decided against the railroad company, viz., to the effect that the Government did not grant to the railroad company mineral lands; but the case, it is said, will be carried up, so that it will lead to a final decision. H. H. Fellows, connsel for the miners, states the legal position attempted to be maintained hy the attorneys for the opposite side thus: If "A" conveys to "B" twenty acres of land, and, in a subsequent part of the deed, excepts from the operation of the conveyance "one acre" there, the reservation is not valid, being inconsistent with the granting clause; and that the same principle would apply to the reservation of mineral land. The attorney of the railroad company, and Gen. Redding, their land agent, assisted Messrs. Tweed & Craig, the attorneys of record, on the trial of the case.

SUBMARINE EARTHQUAKE PHENOMENA.—The following interesting facts were observed by Capt. Christi, of the bark Euphrosyns in Lat. 16° 42′, Lon. 4° W., and are copied from the London *News:*

The sky suddenly became overcast with dense black-looking clouds, and in all directions was heard a noise resemhling distant cannonading, while the sea became tossed and confused. To these signs of agitation another was added of peculiar significance. The compass vibrated largely and almost lost its polarity, a sure sign that a terrestrial disturbance of great extent and violence was in progress. Several large meteors shot out from the heavens. Fish jumped out of the sea and struck against the sides of the ship. The volcanic action of the sea continued during the night until sunrise, when the weather became clear and settled.

PROPOSED ATLANTIC BALLOON VOYAGE IN MAY.—Prof. Chevalier, a celebrated French aeronaut, recently arrived in New York city, announces his intention to make the attempt of an aerial voyage across the Atlantic. The Professor in his European exploits made a voyage from Paris to Russia, distance seven hundred miles, in five hours. Mons. Chevalier says it is his intention to demonstrate the continnous belts of currents which are presumed to exist at an elevation of ten thousaud feet. His vessel, the *L'Esperance*, is 90 feet in hight, 150 in diameter, and requires 120,000 cubic feet of gas. The car is inclosed, resembles a bamboo hut, and will contain fifty-two persons.

SUMMER OF 1869.—Expectation, commercial and social, was never so lively in this nation as during this season. Especially this may he said with regard to Californians. Folks are ou tiptoe for spring developments. Who will have this or that "trade?" What are the best plans for securing this or that market? And there are very few of our people, who have their native homes in the Eastern States, who are not either expecting a visit from relative or olden and near acquaintance, via the Pacific Railroad, next summer, or intending to make the overland trip to the places where they resided in childhood days. There is going to be a vast amount of cordial handshaking across the continent this year. The Grand Lodge of Odd Fellows holds its National Convention in this city next September—a gathering to be reminded of in this connection.—*S. F. Times.*

GAS AND WATER FOR MAZATLAN.—Messrs. Howell & Larriaga have obtained the privilege of maintaining gas works in Mazatlan, for the term of twenty-one years, and the schooner "Montana" has landed the necessary materials on the ground, all of which are to be in use within three months. Mr. Howell has engaged the services of a Mr. Cole to test the possihility of supplyiug that city with good water by artesiau wells.

COCOS ISLAND treasure hunting expeditions agree with the adventurous tastes of Californians, and seem destined to he repeated again and again, for the edification of those who will court romance at the expense of failure. Another party just heard from via Panama, has returned, worn out and disgusted. They spent nineteen days there in the vain pursuit, looking for the hidden riches, and then gave up the hunt as entirely Utopian.

DR. HAYES has been lecturing on Arctic Researches before the New York Geographical Society. He is willing to try again to explore the Northern Ocean, which he says is never frozen.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half inch) bore; and .451 (or small) bore

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Soldier Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIGGES. .451 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIGGES for Lefaucheux Revolvers of 12 M, 9 M. and 7 M. bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Wadlines to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR FEBRUARY, 1869.

The following Steamships will be dispatched on dates as given below:

February 6th—GOLDEN AGE.....Capt. E. S. Farnsworth, Connecting with ALASKA, Capt. Gray

February 14th—COLORADO.....Capt. Wm. H. Parker, Connecting with RISING STAR, Capt. King.

February 22d—SACRAMENTO.....Capt. A West, Connecting with HENRY CHAUNCEY, Capt. Connor.

February 27th—MONTANA.....Capt. Wm. Hudson Connecting with ARIZONA, Capt Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship JAPAN, Captain George E. Lane, will be dispatched on THURSDAY, February 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

DEWEY & CO.,

American and Foreign Patent Agents,

Publishers and Proprietors of the MINING AND SCIENTIFIC PRESS, the only well established successful Patent Agents on the Pacific Coast, will give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are Kept Inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

DEWEY & CO.,

Patent Agents, Publishers and Printers, 414 Clay street below Sansome, San Francisco.

A. T. DEWEY. W. B. EWER.

Kustel's Treatise on Concentration of all kinds of Ores.

Including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally. Illustrated with 120 Diagrams on 7 Plates.

CONTENTS:

I.—Introduction.

1. The Dressing.—Dressing of Ores; Principles of Dressing; Division of Dressing.

2. The Separation.—Separation of Gangue from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.

3. Cleansing and Sizing Contrivances.—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Rocker; The Cirenlar Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.

4. Rotary Sizers.—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Grains for Jigging.

II.—Reduction.

1. Reduction of Ores.—Reduction of Ores to a Proper Size; Breaking under Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.

2. Description of Batteries.—The Foundation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.

3. Details of a Battery.—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tappet; California Tappet; Cams—Wooden Cams; Iron Cams.

4. Speed, Curve and Order of Lifts.—Limit of Speed in Crushing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.

5. The Discharge of Batteries.—The Discharge in Dry Crushing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing — the Grates and Screens.

6. Feeding of Batteries.—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed and Weight of Stamps.

7. Reduction by Rolling Mills.—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.

8. Grinding.—The Arastra or Tehama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer: Cylinder Mills; Ferrand Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.

9. Pans with Plane Mullers.—The Common Pan Grinders; Tub Grinder; Bartolo's Grinder; Knox's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gaston's Grinder.

10. Pans with Conical Mullers—Hepburn & Peterson's Pan; Belden's Pan; Banx & Guiod's Grinder.

11. Pans with Tractory-Conical Mullers.—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.

12. Pans with Perpendicular Mullers.—The Centrifugal Ore Grinder; Varney's Quartz Grinder.

III.—Concentration.

Concentration of Reduced Ore.—Division.

A. Concentration of Ore Grains (Jigging Stuff).—The Principle; The Jigging.

1. Movable Jiggers.—The Movable Jigger.

3. Stationary Jiggers. — Hydraulic Jigger; Petherick's Separator; Stationary Jigger.

4. Continual Jiggers. — Percussion Jigger, Setz Herd); Continual Cylinder Jigger; Continual Jigger; Hydraulic Continual.

5. Rotary Machines.—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setz-Rad); The Dolly Tub; Aufermau's Dry Jigger.

B. Concentration of Ore Sands and Slimes.

6. Assorting of Sands.—The Labyrinth; Borlace's Slime Separator; Ph. Hofmann's Separator; Rittinger's Fanuel or Pointed Box; Rittinger's Spitz-Lutte.

7. Feeding of Concentrator.—Feeding-Boxes; Stationary Feed-Box; Rotating Feeder.

8. Stationary Concentrators.—Hand Buddle; Sleeping Table; Rack; Sweeping Tables; Round Buddle; Concave Buddle; Blanket Tables.

9. Percussion Tables.—Percussion Tables; German Percussion Table; Continual Percussion Table; Hunter's Continual Percussion Table; Varney's Percussion Buddle.

10. Oscillating and Shaking Tables.—Borlace's Concentrator; Hendy's Concentrator; Hungerford's Concentrator; Barron's Concentrator.

11. Steady Moving Concentrators.—Concave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self-Discharging Blankets; Horizontal-Moving Blanket.

IV.—Special Concentration.

1. Concentration of Gold Ores.—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Concentration and Amalgamation; Treatment of Concentrated Stuff.

2. Concentration of Silver Ores; Concentration Works; Cost of Concentration; Concentration of Tailings.

3. Concentration of Lead and other Ores.—Concentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—Chlorination.

Extraction of Gold from Sulphurets or Arsenicals by Chlorinatiou; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Single Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Damping of the Roasted Ore; Sifting; Production of Chlorine Gas; Lixiviation; The Precipitating Vat; The Precipitation; Cost of the Chloriuation Process per ton of Ore; Remarks.

Other Methods of Dissolving and Precitating the Gold from Sulphurets.—Chlorination at Reichenstein; Chlorination at Schemnitz; Calvert's Method for Auriferons Quartz; Extraction of Gold, Silver and Copper.

PRICE. - - - - - $7.50 per copy.

Sent by mail, and sold wholesale and retail, by DEWEY & CO., publishers, office Mining and Scientific Press, San Francisco.

United States Postal Rates.

Letters to any part of the United States, 3 cents for each half ounce, or part thereof.

Drop Letters, (sent for each half ounce, where there is no delivery by carriers, and 2 cents where there are carriers.

Advertised Letters, 1 cent in addition to the regular rates.

Valuable Letters may be registered on application at the office of mailing, and the payment of a registration fee not exceeding 20 cents.

Transient Newspapers, Periodicals, Pamphlets, Blanks, Proof Sheets, Book Manuscripts, and all mailable printed matter (except books), 2 cents for each and every 4 ounces. Double these rates are charged for books.

Unsealed Circulars (to one address), not exceeding 3 in number, 2 cts, and in same proportion for a greater number.

Seeds, Cuttings, Roots, etc., 2 cents for each 4 ounces or less quantity.

All packages of mail matter not charged with letter postage must be so arranged that the same can be conveniently examined by postmasters; if not, letter postage will be charged.

All postage matter for delivery within the United States must be prepaid by stamp (except duly certified letters of soldiers and sailors).

Weekly newspapers (one copy only) sent to actual subscribers within the county where printed and published, free. Out of the county, but within the United States, 6 cents per quarter, payable at office of delivery, in advance.

Postal Money Orders, for $30 or less, 10 cents; over $30 to $30, 15 cents; over $30 to $40, 20 cents; over $40 to $50, 25 cents; each additional $50, 25 cents.

The maximum weight of any package of printed or miscellaneous matter is 4 lbs. avoirdupois.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

IMPROVED INNER SOLES

—FOR—

BOOTS AND SHOES.

Those who have worn Daggett's Patent Elastic Ventilating Inner Soles, are unanimous in testimony that the correct principle has been hit upon and reduced to practical and successful use. The foot rests upon a cushion of air cells between points of vulcanized rubber, every cell opening freely into each other and through the space occupied by the foot. There is no contact of the foot with the wet bottom of the boot. The elastic points sustain the weight of the wearer, leaving an air space always, between the foot and all dampness. Every step compresses and restores the air chambers, thus constituting hundreds of air pumps, working at every step of the foot.

The rubber points will not absorb the moisture from the boot, so that the soft flannel which covers them is always dry. Their springing elasticity renders them of peculiar value to the aged and infirm, who feel the jar of walking upon hard substances, also to all persons whose business requires much walking or standing.

These soles are affording great relief to persons afflicted with rheumatism and consumptive complaints, chilblains, corns, cold and sweaty feet.

For warm and dry feet use the Patent Elastic Ventilating Inner Soles.

No. 13 Exchange Street, Boston, Oct. 15, 1867:—This may certify that I have used the Patent Elastic Ventilating Inner Soles, through the spring and summer past, and have found them to be the best contrivance for keeping the feet dry and comfortable, that I have ever used, and for any one having corns or tender feet, the best article ever invented. CHARLES K. DARLING, Stationer.

Patent Elastic Ventilating Soles—If you wish a comfortable article for your feet, a real luxury in cold weather, obtain a pair of the Patent Elastic Ventilating Inner Soles. Having used these soles the past winter, we can safely recommend them as tending not only to promote the comfort of the feet, and ease in walking, but also the equalization of the temperature of the feet, which renders them almost invaluable.—[Boston Traveler, Oct. 1867.

Price, per pair, **$1**. By mail, postage paid, **$1.25**. For sale by PATRICK KELLY, No. 327 Bush street, San Francisco. 3v15tf

Read and Subscribe.

With the advantages of past experience, the increased patronage and friendly support of the intelligent and progressive readers of the Pacific States and Territories, we are confident in asserting that the new volume of the Mining and Scientific Press, commencing with 1869, shall be in all respects superior to its predecessors. Of the past, we will give the written

OPINION OF OTHERS:

Every miner in the community should subscribe for the Mining and Scientific Press.—*Grass Valley Union.*

Mining and Scientific Press.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

The *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec.* 19.

W. Frank Stewart is Dewey & Co's accredited agent for the Patent business in this city, and will attend to their affairs in that specialty.—*San Jose Mercury.*

Mining and Scientific Press.—This journal is devoted to mining and scientific researches, and has been conducted with great ability. It has been greatly enlarged and improved.—*San Jose Patriot.*

The Mining and Scientific Press has become almost indispensable to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 16th.*

To all we may wish to obtain a thorough knowledge of the industrial resources of the Pacific Coast, the Press will be found a valuable paper.—*Oakland Trans script.*

The Press is a credit to the State, and is fast gaining in popularity. It commends itself to all classes, and we hope many in this section will become subscribers.—*Pajaronian.*

These gentlemen not only print a first-class scientific and mining journal, but are also trustworthy Patent Agents, and doing much towards the inventive business of this coast.—*San Jose Mercury.*

The *Mining and Scientific Press* is one of the best papers of the kind ever published, and to California miners, especially, it has become an almost indispensable requisite for the successful prosecution of their calliug.—*Nevada Gazette,*

New Volume.—The Mining and Scientific Press has entered upon another year's work looking improved and promising. This paper is devoted to the interests of the scientific world, and to the miner and mechanic is almost invaluable.—*Gilroy Advocate.*

The Mining and Scientific Press comes to us this week in a new dress throughout, much improving its appearance. The Press is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner.*

The Mining and Scientific Press commenced a new volume with the new year. It is a credit to the State, and to the mechanic or miner, is a great source of valuable information. It has every appearance of prosperity, and we hope it may continue growing in wealth and influence.—*Pajaronian.*

To Miners.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

We Consider the Mining and Scientific Press the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

A Valuable Paper.—For many years after the American settlement on this coast, a journal devoted entirely to mining and scientific interests did not exist. Vast sums of money were expended, or rather squandered, by capitalists and others, for lack of proper practical and scientific information about the mines and their development. This necessity has been fully met by the Mining and Scientific Press, published by Dewey & Co., at No. 414 Clay street, San Francisco.—*San Jose Mercury.*

Mining and Scientific Press.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The Press is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, but more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

A Useful Publication.—The Mining And Scientific Press, published at San Francisco by Dewey & Co., is a publication valuable to all classes and indispensable to miners and inventors—the patents for nearly all California inventions having been secured through the Patent Agency of the proprietors of that paper, and the inventions themselves brought into notice through its columns. We are glad to learn, from Mr. Wm. H. Murray, the traveling agent of the paper, who dropped in upon us Monday evening, that its merits are so well appreciated; and we unhesitatingly commend both the paper and its gentlemanly agent to the confidence and patronage of scientific and practical men of all classes and every occupation.—*Solano Herald.*

Subscription Terms, in advance, $5; six months, $3. Specimen Nos. of the paper and Circulars of Information for Inventors, sent free on application.

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of December, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J. Middleton & Son, 310 Montgomery street, San Francisco, on Monday, the eighth day of February, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOUSE, Secretary.
Office, 318 California street, up stairs, San Francisco. j23

Postponement.—The above sale is hereby postponed until Thursday, the eighteenth day of February, 1869, at the same hour and place. By order of the Board of Trustees.

feb6 JOHN F. LOUSE, Secretary.

By Express.—Two cents per copy will be added to our usual rates of subscription (in pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Portable Engines.

Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Owen and Darwin.

A chapter from the forthcoming edition of Prof. Owen's "Anatomy of Vertebrates" is given by the *American Journal of Science and Arts*. The respective hypotheses of the two philosophers are therein constrasted,—Owen's "Derivations" and Darwin's "Natural Selections." We quote:

According to my derivative hypothesis, a change takes place first in the structure of the animal, and this when sufficiently advanced, may lead to modifications of habits. As species rise in the scale, the concomitant change of structure can and does lead to change of habits. But species owe as little to the accidental concurrence of environing circumstances as Kosmos depends on a fortuitous concourse of atoms. A purposive route of development and change, of correlation and interdependence, manifesting intelligent Will, is as determinable in the succession of races as in the development and organization of the individual. Generations do not vary accidentally, in any and every direction; but in preördained, definite, and correlated courses.

"Derivation" holds that every species changes, in time, by virtue of inherent tendencies thereto. "Natural Selection" holds that no such change can take place without the influence of altered external circumstances educing or selecting such change.

"Derivation" sees among the effects of the innate teudency to change, irrespective of altered surrounding circumstances, a manifestation of creative power in the variety and beauty of the results; and, in the ultimate forthcoming of a being susceptible of appreciating such beauty, evidence of the preördaining of such relation of power to the appreciation. "Natural Selection" acknowledges that if ornament or beauty, in itself, should be a purpose in creation, it would be absolutely fatal to it as a hypothesis.

"Natural Selection" sees grandeur in the "view of life, with its several powers, having been originally breathed by the Creator into a few forms or into one." "Derivation" sees, therein, a narrow invocation of a special miracle and an unworthy limitation of creative power, the grandeur of which is manifested daily, hourly, in calling into life many forms, by conversion of physical and chemical into vital modes of force, under as many diversified conditions of the requisite elements to be so combined.

"Natural Selection" leaves the subsequent origin and succession of species to the fortuitous concurrence of outward conditions: "Derivation" recognizes a purpose in the defined and preördained course, due to innate capacity or power of change, by which homogeneously-created protozoa have risen to the higher forms of plants and animals.

The hypothesis of "derivation" rests upon conclusions from four great series of inductively established facts, together with a probable result of facts of a fifth class; the hypothesis of "natural selection" totters on the extension of a conjectural condition, explanatory of extinction to the origination of species, inapplicable in that extension to the majority of organisms, and not known or observed to apply to the origin of any species.

FOURIERESTIC COLONY.—A company has been formed in this city of men who propose to emigrate with their families to White Pine in the spring, in which the principle of coöperation has been carried to the Fourier limit. The company consists of twelve men, their wives and little ones. They are having their house framed on the Truckee; ready to be freighted piece-meal to Treasure City in March. A "corner grocery store" will occupy one angle in the building; the company members will all reside in the house, and have rooms to spare for strangers; they will keep a hotel as well as a grocery, and the wages and mining speculation investments and profits will be in community. A wing of the main building is to be devoted to the brewery business, and the erection of a small flouring and feed-mill is among the list of enterprises contemplated by this company.—*S. F. Ex.*

THE BITUMINOUS SHALE AT ELKO is of a light, yellowish-brown color, and upon being ignited in the flame of a candle burns readily, with a clear flame and much heat. While burning it gives out no bituminous smell. A quantity being put in a stove at Elko and a full draft turned on, it burned so fiercely that the whole stove—and pipe for some feet above—was heated red hot, and the stove plates cracked in two or three places. The shale resembles the petroleum-soaked rock found in Butter Creek Valley, though no traces of oil are to be seen in it while burning.

MINERAL STATISTICS. — Ross Browne gives the following statistics of the production of the precious metals in this country, since 1848:

Total product, $1,300,000,000; of which California furnished over $900,000,000, Nevada $90,000,000, and Oregon $20,000,000; waste on account of imperfect or improvident mining $300,000,000,—which is attributed to reckless haste and impatience. The present yearly product he estimates at $75,000,000, of which $25,000,000 comes from this State, $20,000,000 from Nevada, $2,000,000 from Oregon, $18,500,000 from Idaho and Montana. Colorado has produced altogether only $25,000,000, and now yields but $2,500,000 yearly.

The product of California is now derived as follows: From surface diggings, $2,000,000; from cement or deep-lying placers, $18,000,000; from quartz mines, $9,000,000.

In many parts of Nevada, silver ores bearing $100 a ton, and in Montana and Idaho, gold ores of $50 a ton "will not justify working."

COLOR-BLINDNESS.—Dugald Stewart could not distinguish between red and green, and John Dalton did not know blue from crimson. In the solar spectrum, instead of red, orange, yellow, green, blue, indigo and violet, Dalton only saw three colors, yellow, blue and violet. He could distinguish no difference between the scarlet gown of a cardinal and the foliage of the trees; and when one day he dropped a piece of red sealing wax in the grass, he had great difficulty in finding it again. Mr. Dalton's case has given rise to the term *Daltonianism*, which is now generally applied to this kind of color-blindness.—*Gas Light Journal.*

GLACIERS.—"In a former age the whole United States was covered with ice several thousand feet thick, and this ice, moving from north to south by the attraction of tropical warmth, or pressing weight of ice and snow behind, ground the rocks into the paste we call the soil. These masses of ice can be tracked as surely as game is tracked by the hunter. The stones and rocks ground and polished by the glaciers can easily be distinguished from those scratched by running water. The angular boulders found in meadows and the terraces on our rivers not now reached by water, can be accounted for only in this way."—*Prof. Agassiz.*

THE OLDEST TREE IN EUROPE is asserted to be the cypress of Somma, in Lombardy, Italy. This tree is believed to have been in existence at the time of Julius Cæsar, forty-two years before Christ, and is, therefore, 1901 years old. Superior antiquity is claimed for the immense tree in Calaveras County, which is supposed, from the number of concentric circles in the trunk, to be 2,565 years old.

RAINFALL DATA.—The Los Angeles *Star*, of January 23d, says farmers are beginning to stop plowing, in consequence of the continued drought.

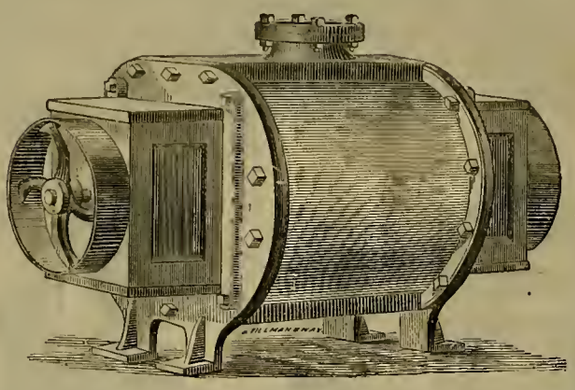
A WARNING
TO ALL WHO ARE AFFLICTED.

Before the rainy season comes get cured of Rheumatism and Neuralgia, by herbs only. The receipt was given some years ago by an old Indian in New Orleans, and it has never failed to cure all it says. Many have been cured in this city and in Boston, and all say it is the best they have tried. Manufactured by MRS. MARY HIGGINS, Oregon street, two doors west of Drumm. Orders sent by mail or express attended to on receipt of $5 per bottle. 22v17-3m

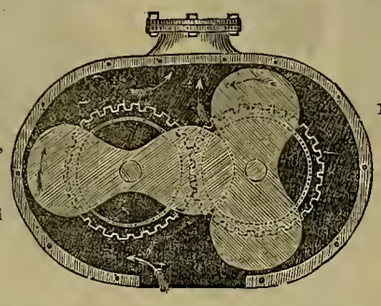
Small Pox.

We have been shown by Wm. Zelner, the best and most convenient and portable apparatus containing Chlorine, for rooms, which we consider the best disinfectant out, and should advise all housekeepers not to be without one. Price $1, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 18 Geary street, 25v17-3m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

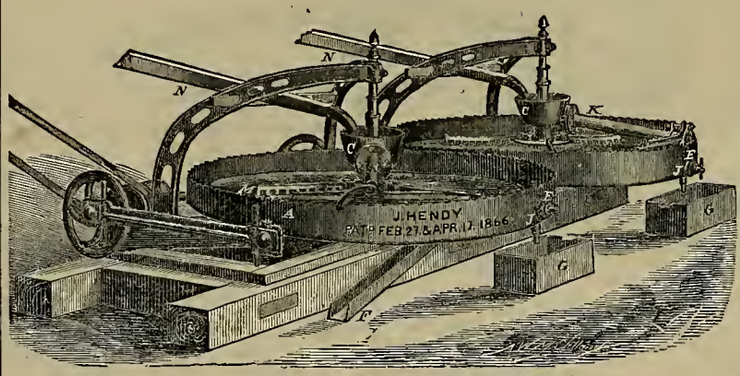
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

VAN NOSTRAND'S ECLECTIC ENGINEERING MAGAZINE.—We have received the first number of a new monthly magazine with the above title,—large octavo, having ninety-six pages filled with the most valuable reading matter to engineers and mechanics, and published at $5 a year, or fifty cents a number. The editor is Alexander L. Holley, of the Troy Bessemer Works. From the word "eclectic," as well as from the introduction of the editor, it may be inferred that most of the leading articles are to be copied from English, French, and German engineering periodicals; at the same time that the American field is to be properly canvassed for the kind of matter that is required by the profession in this country. In view of the fact that the American materialistic penchant has so much to do with engineering, and has developed a great deal in that field which is new to the old world, it seems strange, now that we see before us an American magazine devoted specially to the subject, that we have not had anything of the kind before. But we have only to bear in mind how very undeveloped, comparatively, our country, with all its promising special fields, has been up to the time of the war, and to the building of the Pacific Railroad. This engineering magazine is a desideratum, which, if not very seriously mismanaged, cannot fail to become speedily an institution and a power in the land. Amongst the leading papers, are: Excavating in Quicksilver, by W. J. McAlpine, from a report read before the American Society of Civil Engineers; Composition of Steel, translated from the Berg and Hütten-Zeitung, by John B. Peavse, M. E.; Freight Locomotives; Rubber Tires; Preserving Timber; Liquid Fuel; Railway Accommodations, etc.

UNDERGROUND LIFE, OR MINES AND MINERS.—We have received from H. H. Bancroft & Co., a large octavo volume of this title, containing 520 pages, splendidly printed, and illustrated by 160 artistic engravings on wood, 20 maps geologically colored, and 10 plates of metals and minerals, chromo-lithography; by Prof. L. Simonin, of the Paris *Ecole des Mines*, who visited Colorado eighteen months ago. The work is translated and adapted to the present state of British mining, and edited by H. W. Bristow, F. R. S.; published by D. Appleton & Co., New York. Further notice will be made of the book in our next issue.

Mechanical Movements.

We continue (from page 49) our illustrations of mechanical movements:

67. Rectilinear into circular motion. Pawl on one arm acts on the wheel when the rod moves in one direction, and the other when the rod returns.

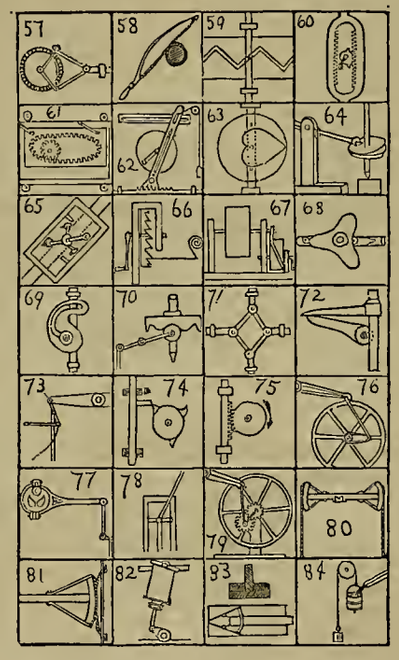
68. Fiddle drill, used by watch-makers. String of the bow passes round the pulley on spindle of the drill

69. Reciprocating into circular motion by up and down motion of pin on the slide, in zig-zag groove on cylinder.

60. Reciprocating into rotary motion.

61. Reciprocating motion to a frame by means of endless rack and pinion.

62. Imparting a reciprocating rectilinear motion to a toothed rack by a toothed segment secured to a lever-arm, which is subjected to the action of a weight, and of an eccentric wrist-pin, projecting from the side of a revolving disk.



63. Rod reciprocates by means of heart-shaped cam.

64. Converting continuous revolving into reciprocating revolving motion by a cam-disk acting on an oscillating lever.

65. Revolving into reciprocating rectilinear motion, by means of roller-arms, extending from a revolving shaft, and acting on lugs projecting from a reciprocating frame.

66. Reciprocating motion by toothed wheel and spring bar.

67. Cam groove in drum to produce reciprocating motion.

68. Reciprocating rectilinear motion by means of a cam.

69. Variable velocity of bar by slotted arm on shaft.

70. Rotating scolloped wheel gives rectilinear motion to rod.

71. When the upper and lower rods are brought together, the right and left are separated.

72. Toe and lifter for working engine valves.

73. Parallel motion for piston-rod of steam engine.

74. Stamp and lifting cam.

75. Same purpose, with rack and mutilated pinion.

76. Working-beam and fly-wheel.

77. Eccentric or cam, and elbow lever.

78. Cross-head and guides.

79. Oscillating motion of beam into rotary motion by sun and planet wheels.

80. Double-acting beam.

81. Single-acting beam.

82. One form of oscillating engine.

83, Bowery's joiner's clamp; plan and transverse section. Oblong bed has, at one end, two wedge-formed cheeks, adjacent sides of which lie at an angle to each other, and are dove-tailed inward from upper edge to receive two wedges for clamping the piece or pieces of wood to be planed.

84. Obtaining motion from a fall of water. The bucket empties itself as it touches the ground by a valve in the bottom.

SEALS ON THE NORTHWEST COAST.—During the spring, after the 15th of April, seals and sea lions settle in myriads in Behring's, Copper, Blijnec, Andreanoviki, Fox, St. Paul's and St. George's Islands, and the business of hunting them for their fur and oil already engages many Californians and Puget Sound people, not mentioning coast Indians and Russian half-breeds; larger profits being returned here than in the Labrador seal fishery, or on the Norwegian coasts. A returned seal hunter furnishes the *Mercantile Gazette* with some information on the subject, which we condense as follows:

The male seal, or sekach, in the spring, guards more than two hundred females. The sekach is very large, and has great influence over the herd of females. It seeks out the highest rock on the coast, where it can rest or play. A skillful hunter will never kill the sekach while it is on the rocks, as that would drive away the seals. Females give birth to young in the mouth of September, and the rocks are then covered with pups. They never have more than two in a litter. Their voices resemble the bleating of young lambs. They are suckled by the mother until they are able to go into the water, when they are required to look out for themselves. Seal go up on the beach in foggy weather, or in the evening. They are so fat that in hot weather they prefer the water. After sunset the Aleuts drive them back towards the mountains; then they separate the females and young ones from the males, kill all the males for their oil, and drive the other portion back into the sea. A seal hunting firm last summer had 40,000 females one year old killed in August and September for their furs.

Seal oil is worth seventy-five cents per gallon, and is very superior for machinery and lamps. The Americans trading in Alaska last summer did not pay any attention to the seal oil. They all went after furs. The oil of 400,000 seals was thrown into the water. The seals at the end of October and the early part of November, emigrate to the southwest, or to the Japanese Islands. They are not afraid of the ice, but prefer a milder climate in the winter season.

At a recent meeting of the Chamber of Commerce it was stated that the objectionable bill relating to the Alaska seal fisheries, which was introduced by Senator Cole, and alleged to afford a monopoly of the business to Hutchinson, Kohl & Co., had been withdrawn, and another bill less objectionable in its features introduced in its stead. The new bill prohibits the killing of female seals, levies a duty of $2 upon each seal skin, and limits the number of seals to be killed to twenty-five thousand per annum on four of the principal islands. It authorizes the Secretary of the Treasury to advertise for proposals for killing the seals allowed to be taken, as seals are only found on a few islands in Northern Pacific waters, and one island in the Atlantic on the American side, stringent measures are deemed necessary for their protection.

JOHNSTON'S PROCESS OF DISTILLING BRANDY.—This consists in the substitution of a column rectifier between the still and the usual worm. In this column, the spirit as distilled is washed in water repeatedly before condensation, and the fusil oil thereby thoroughly extracted. Both the still and column are graduated by the use of water, each having thermometers indicating the temperature inside and the strength of the spirit at the same time, so that the distiller has the whole operation under complete control.

A sample of brandy manufactured by this process at B. N. Bugbey's vineyard, near Folsom, from Muscatel pummace, has been sent to this office, which, though 35 per cent. above proof, possesses an unusual smoothness for its age, with the delicious perfume and flavor of the grape from which it was made. We have also received from the above mentioned vineyard a box of native raisins, and a branch about two feet long, upon which were *nine* oranges. The tree from which it was taken was about eighteen feet high, and was literally covered with the golden fruit. The raisins are of fine quality, and in some respects superior to the imported article.

MINERAL WEALTH OF CALIFORNIA AND ADJOINING TERRITORIES.—Under this title Dr. Burkert of Bonn, is furnishing an able resumé of all that is known from published sources, in the columns of the *Berg and Hutten Zeitung*.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Oregon and its Resources.

Salem, Oregon, Jan. 31, 1869.

Editors Press:—I have been spending the winter in this land of rains and fogs, as common fame has it, but I have so far not been able to realize the appropriateness of the designation from any extraordinary rain or fog demonstrations encountered up to the present date. The winter has been much of the California type; no snow, and but little ice in the streets of Salem.

This City of Peace is in the center of the great Willamette Valley,—a valley extensive enough for a kingdom, and with a soil capable in its fertility of sustaining a population of three millions. Everybody knows, however, about the capital of Oregon, with its university, its medical college, its flouring mills and woolen factories, its numerous churches and flourishing schools. The great Oregon Central R. R., commencing at Portland, destined to reach San Francisco with a branch to tap the Pacific Central at the Humboldt, passes through Salem. The work is far advanced; the grading complete from here to Portland, and some of the bridges erected.

The Cascade Mountain range bounds the valley on the east, and the Coast Range on the west. In these ranges the tributaries of the great Willamette river have their origin, each forming its own subordinate valley, digitations to the grand Willamette plain.

The mineral treasures of these mountains have never been explored. The most superficial observation, however, proves that great wealth lies slumbering among their rocks. An interest is now springing up in their behalf from the late discoveries made in both ranges. I am in receipt of fine specimens of gold, copper, iron, cinnabar, marble, lead, zinc and antimony, and letters have reached me in regard to discoveries in Coos County, of the utmost importance, but it is desired not to give details for the present.

The Santiam mines were much talked of a year or two back. They fell into disrepute from the ill-directed efforts made at working them. I have however come to the conclusion from a personal examination that a rich mining region surrounds the abandoned mill and camp at Quartzville. From numerous assays I made but recently of samples from that vicinity, I can come to no other conclusion than that there are some valuable lodes there.

The district of Bohemia, south of the Santiam mines in the same range, the Cascade is claimed to be rich and extensive. As to the richness of ore I can myself testify, and have no reason to doubt the reported length and width of the leads.

Along the margin of the valley on either side, and indeed in the center, mineral matter of great value is to be encountered. Coal of tolerable quality, excellent iron ore, fine potter clay, and in one locality at least, a superior material for fire bricks, I have seen myself. Mineral waters also abound. A spring having all the properties of the *Congress water* of Saratoga, is within twenty-five miles of Salem. I have experienced and tested the mineral matters of three different localities in the neighborhood of Salem, and one near Portland, remarkably rich in borax. Brine springs affording an excellent article of culinary salt, are found both near Salem and Portland. In short there is no end of the elements of wealth lying loose around and at the very doors of the Oregonians, if they only would take the trouble to examine. I may be able to give details of some of these valuable things, so soon as weather permits comfortable field exercise. J. A. V.

Oceanic Earthquake.—The self-registering tide gauge at Fort Point, which never fails to record the slightest variation in the tide level, indicated, on the 10th instant, an unusual disturbance, in all probability caused by a submarine earthquake.

Alpine County as a Mining Field.

In a two and a quarter column communication published in the New York *Tribune* of January 12th, Mr. J. Winchester, (himself formerly one of the editors of the *Tribune*,) has furnished an able account of the mining interests of Alpine County, with which he has become identified. He says:

"The mineral districts of Alpine County are of far greater extent than that developed in and about Virginia. There are a dozen or more of them, but the most prominent are Monitor, Silver Mountain, Great Mogul, Alpine, Scandinavian, and Raymond. The mineral lodes are more numerous, some of them even of greater magnitude, than the Comstock, while in the average richness of the ores the latter bears no comparison to those of Alpine. In the facilities for cheap working, the mines of Alpine are unsurpassed by any other on this continent. The Carson River and its tributaries, which are principally fed by the Alpine snows, furnish a water-power sufficient to drive thousands of stamps, to which the mineral ledges are all in close proximity.

By an improvement in the "Plattner gold and silver chloriuation process," put into operation on the Star ores during the past two months by Messrs. Hoffman & Kustel, two experienced German metallurgists, the most surprising results have been obtained. It is found that all the valuable metals—gold, silver, and copper—can be extracted to within 4 per cent of the assay, *at a cost of treatment not exceeding twelve dollars per ton.* The first lot of this ore, worked at the Pioneer mill, at Markleeville, near the mine, gave a product of about $400 per ton. This method of treatment, adapted alike to all kinds of sulphuret ores, no matter how refractory, ushers in a new and prosperous era in mining, for it brings the lowest grade of ores known in the silver regions within the scope of profit, while the yield on the higher grade ores will make *good mines* productive beyond the dreams of the most sanguine. Long neglected by capitalists, in San Francisco and the Atlantic States, under the impetus of the recent improvements in the reduction of ores by which the product is *maximum* and the cost *minimum*—with a wide margin for profit between, Alpine County will take rank as a bullion-producing district ere many years, second to no other within the bounds of the mineral region of the Union."

Mr. Winchester has fallen into a common error in supposing the Kustel & Hoffman process to be the same as the Plattner chloriuation process. In point of fact the two processes have nothing in common but the leaching tub. Plattner's chlorination is applied to gold, and consists in the use of quantities of free chlorine gas, made with the aid of oxide of manganese, to change the metal into soluble chloride of gold. In Kustel's process, the success of which has proved so satisfactory in the treatment of the Star argentiferous copper and lead ores, the only chlorine generated, is done precisely as in the usual process with salt; and the "trick" consists in not chloridizing the silver at all, as is the case in the preparation for pan amalgamation, but in managing the temperature so as to chloridize the base metals only, which are thereby rendered soluble, and capable of being leached out, and so got rid of for the succeeding amalgamation.

The Sutro Tunnel bill has now taken the title of an Act to aid in ascertaining the value of the public lands containing mineral lodes, and for the endowment of a national school of mines; being the former bill as it has been amended, but introduced by Mr. Ashley, of Nevada, for legislative reasons, as a new bill.

Chinese Remedy for the Vine Disease.—The Chinese,—it is said,—use a thick paste made of flowers of sulphur and aluminous clay, as a remedy for the vine disease. The paste is laid upon the ground about the vine.

Perm, the great metropolis of the Russian iron mining and manufacturing districts of the Ural foothills, has added to its industries a great gun factory, within a few versts distance, on the banks of the Kama.

Proposed Mining and Metallurgical Commission to Europe.—A Washington telegram says:

Senator Conness has presented a memorial in Congress signed by about fifty distinguished citizens, composed of professors of colleges and mining schools and leading citizens and experts in metallurgy, who pray for the appointment of a Commission to visit the various mines in Europe and report upon the modes of treating ores containing the precious metals. The memorial was ordered to be printed and referred to the Committee on Mines and Mining. Professor Sykes, the gentleman who is urging this matter upon Congress, will have a hearing before the House Committee on Mines and Mining during the present week.

It is presumed that Professor Sykes will furnish good and valid reasons why he should not undertake the trip at his own expense, as dozens of others have done within half a score of years past, who have devoted much more time and labor to the subject than Professor Sykes is likely to do. If a "Report" is wanted, it may be stated that we already have one, from Prof. Blake, on the subject, published by the State of California. If information about European processes,—the same is accessible in the proper books and periodicals, which are generally already in the possession of all our intelligent mining managers. If advice is to be given as to the best processes, for all kinds of ores and metals in this country in general or in particular, Professor Syke's opinion will not be taken for anything more than it is worth, and will certainly not be in advance of the intelligence of many of our working metallurgists.

There can be no harm, however, in sending such a commission; only that it is well to understand in whose interest, and as definitely as possible to what purpose, the proposition may be set on foot.

Kiln Drying Lumber.—We are informed that steps are being taken by some gentlemen connected with the lumber interests, to establish a new lumber seasoning process near the foot of Third street. One of these seasoning processes common in the Atlantic States, consists in the use of a kiln called Buckley's Patent Dryer, a low brick building, tightly covered or ceiled overhead, with close folding doors, making it as near air-tight as possible. It is fitted with rail track and large car, on which the lumber is piled by thousands, with slats or laths intervening between each layer of boards, when it is run into the house and the doors closed. In an adjoining building is a large boiler for generating steam, which is superheated and introduced into the dry-house through pipes, where a constant and uninterrupted supply is kept up for from twenty-four to forty-eight hours, when the last drop of moisture will be found to have left the lumber, and it becomes impossible to shrink it more. Lumber seasoned in this way does not shrink after being manufactured, and is used in cabinet-work and fine finishing. Every large lumber dealer in Chicago is said to have one of these dryers, without which they would be unable to supply the market with seasoned lumber. Where green lumber has to be transported any distance by land, the expense is more than saved in cost of transportation.

The British Iron and Steel Institute.—This new organization progresses. A first meeting, to define its constitution and agree to a code of rules, was held in London on December 16th; and during the present month, February, it is to be formally opened. The Duke of Devonshire was invited to be President. The *Engineer* says this was wise; not only because Englishmen are very fond of having a nobleman at their head,—and because it prevented any possible jealousies among the members of the trade who might conceive themselves entitled to the honor,—but for the reason that the Duke, "in addition to having great possessions in mineral property, is at the head of a concern which is amongst the foremost and the most extensive of modern iron and steel works in this country."

Aniline.—It requires as many as 2,000 tons of coal to produce a circular block of *rosaniline* twenty-four inches high by nine inches wide, but this is sufficient to dye three hundred miles of silk fabric.

California Academy of Sciences.

A regular meeting of the California Academy of Sciences was held on Monday evening January 15th, Dr. J. G. Cooper in the chair. The following persons were elected members: J. W. Hobson, John J. Stephenson, M. D., and Smythe Clark; and proposed for membership, Dr. George Hewston, Mr. Easton, Dr. Aroustein, and James F. Breed.

THE BOUNDS BETWEEN VEGETABLE AND ANIMAL LIFE.

Dr. James Blake read an interesting paper on Amœbæ, and the lower forms of organized matter. He pointed out the more striking peculiarities of the amœbæ, as regards their powers of organization, locomotion, nutrition and reproduction. The habits of this lowest order of what are by courtesy called living beings, but are, in reality, only small masses of glutinous matter, were fully described and illustrated by diagrams, showing their various stages of formation, their several varieties, and that they were found everywhere, even in the sands of our seashore, nearly a hundred feet beneath the surface. Sometimes five or six of these amœbæ join, and they can be divided indefinitely. They often fall into a hundred pieces, each piece being animated and becoming a distinct individual of his species. When the being, which has neither mouth nor stomach, required nourishment, it shut itself around the food instead of receiving it. The lecturer showed by diagrams the curious method by which the creature separates and reforms into other of its species. They are neither animals nor vegetables, yet partake of the nature of both. They have a tendency to continual motion, and these algæ, infusoria, amœbæ, etc., find oxygen necessary to their movements, which cease upon the introduction of electricity or hydrogen.

A number of scientific works were donated to the Academy; specimens of calcareous sandstone by Mr. Yale; fossils from a coal mine in Mount Diablo by Captain John Eckley; and a quantity of acohol for preserving specimens, by James Dows & Co.

THE CANYON LIVE OAK—IGNORANCE OF ITS VALUE.

Professor Kellogg presented specimens of the fruit, foliage and timber of the Golden Decked Live Oak, or Cañon Live Oak *(Quercus Chrysolepis)* of the coast of California, procured by Geo. W. Dunn, a member of the Academy. This oak, Professor Kellogg said, was by some confounded with *Q. Wishizeni*, specimens of which were presented for comparison. The timber is remarkable for its solidity, strength, toughness and durability, only equaled by our southeastern live oak *(Quercus Virens)*. He remarked that his attention was many years ago directed to its use in ship frames, knees, etc., by Captain Morgan, of Bolinas Bay. It was a "burning shame," in his view of it, to have such valuable timber shipped to San Francisco for firewood, out of sheer ignorance of its value. This species must not be confounded with the ordinary live oak, *Quercus agrifolia*, of Oakland, Alameda, and the suburbs of San Francisco. Dr. Kellogg also read a description of *Turritis Americanus Kellogg;* of a new genus *Crinœa Kellogg*, and two new species, *Crinœa cymosa*, and *Crinœa Montana Kellogg;* also a description of a new species *Aster* of Biotia Section, D. C., and *Aster Consanguenea, Kellogg.*

PRACTICAL METEOROLOGY.

Dr. Gibbons moved the appointment of a Committee on Meteorology, to make and collate observations on the climate and atmospheric phenomena of California. One object of such a committee should be to issue a circular to the editors and proprietors of newspapers throughout the State to induce them to publish regular accounts of the atmospheric changes in their respective regions—the quantity of rain, the hour of commencement and termination of storms, and other meteorological facts calculated to assist in the formation of generalizations of value. The phenomena of storms on this coast were quite different from those on the Atlantic side. There the progress of a storm was telegraphed in advance from State to State. The law of storms here was very vague and difficult to understand. He (Dr. Gibbons) had been endeavoring many years to get at the philosophy of our south and southeast rain storms, but without some organized system such as the above, it would be impossible to arrive at results.

The motion to appoint a committee at the next meeting was carried, and the Academy adjourned.

Mechanical.

Rails—Iron or Steel?—This question is still discussed. Steel rails have not fully answered the expectation. Those people who rush to extremes, are therefore loud in their wholesale denunciation of them. But there is probably good reason for their failure to come up to the standard claimed at first. Sample steel rails of superior quality were contrasted with *ordinary* iron rails as a test. The same cause which led to the use of poor iron, has led to the use of poor steel; hence the failure. Again; in the laying of the rails, too little regard has been paid to the peculiar crystalline structure of steel. It will break under circumstances where an iron rail, with its tough fibrous structure, will not. Jarring and pounding will not answer with steel. A slight notch or indentation may serve as the commencement of a fracture, gradually extending, until the rail snaps. This wooden pads have been used in some cases, to obviate these objections,—and with good results. The *American Artisan* says: "The claims and expectations of those interested in the introduction of steel rails have been sufficiently high to permit in very considerable abatement without doing away with the probability that, at no distant period, steel will be almost universally substituted for iron as a material for rails."

Why it Costs so much to Keep a Railroad in Repair.—One reason is that the cross-ties are not all of the same size and length, and consequently there is an unequal amount of bearing surface. As each driving wheel passes over the cross-tie the tie is driven down in the ballast just in proportion as the bearing surface is deficient to sustain the load. Now where the cross-ties are irregular in size, the resisting power to depression varies, the smaller tie sinking deepest, the blow from the driving wheel being aided by the fall so that the effects are aggravated in proportion. This result leaves the track a succession of short and irregular waves. The *American Railway Times* says: Vast amounts of money are expended to secure a smooth and even road bed,—for that is the theory of all railway construction,—and then the practice is to so arrange the superstructure that the evenness and smoothness are at once destroyed, and the trains instead of having that easy gliding motion so favorable to economy of operation and safety, go thumping and pounding over the line, causing a useless waste of power, destroying the road-bed, and every part of the superstructure, and destroying every part of the rolling stock as well."

Pressure better than Hammering for Welding.—Recent experiments by French machinists have shown that continued steady hydraulic pressure in welding, causes complete union of two masses of iron, while the junction is only superficial if produced by the hammer. Among other experiments, two iron bars, 1¼ inches in diameter, were heated to the welding point and brought under the hydraulic press. The welding was effected with extraordinary quickness, the fibers of the iron being thoroughly intercalated with each other, and the joined portion of the bars was quite as strong as anywhere else, a microscopic section of the joint showing a perfectly homogeneous texture.

Liquid Fuel for Steam Vessels.— Dr. Paul concluded from his investigations, that an evaporative efficiency of 13 lbs. of water per 1 lb. of oil burnt might be attained, so that, taking the average duty of coal at 7 lbs. of water evaporated per 1 lb. of coal, the weight of oil required to fuel a vessel would only be about one-half that required of coal, or the weight of fuel to be carried would be only half as much as when coal is used. And taking the ton of coal as stowed on board a vessel to occupy 43 cubic feet, and the ton of oil as occupying 34 cubic feet, the quantity of oil equivalent to 1 ton of coal would occupy only about 17 cubic feet, so that the saving in stowage space would amount to 60 per cent. of the space required for coal.—*London Mining Journal.*

Deer-skins.

From an article in the *American Naturalist*, by Charles Wright, on "Deer-hunting in Texas," we extract the following description of the manner of preparing the skins of the deer for market:

"There are three principal operations: graining, brainiag, and smoking. The skin is dried and afterwards soaked till it is soft; then the hair and grain, or cuticle, are rubbed off with any instrument serving the same purpose as a currier's knife, the skin being spread out on anything answering to the currier's beam. The skin is partially "broken" in this process, and it should be stretched and broken still more, while drying, that it may "take brains" more readily. The brains of the deer, or any similar quantity of another animal will dress the skin. The skin, immersed in it, soon absorbs the brains and becomes thick and spongy. But if the skin be now wetted and suffered to dry without manipulation, it becomes hard again like rawhide. Smoking is a means of obviating this. The object is to make the smoke pass through the pores of the skin. The effect of the brains seems to be to comminute the gluten, but it does not affect its solubility. The smoke seems to form a chemical combination with it, rendering it insoluble. Any dry rotten wood,—hickory, ash, oak, or even cobs,—serves to make the smoke. A hole is dug in the ground about two feet deep and six inches in diameter. Some coals are thrown in and a little of the wood upon them. The skins (better two together) are loosely sewed along the edges, except one, which is stretched around the hole, and the skins are then suspended above it, like an empty sack with the mouth downward. The process is kept up till the operator deems the skin sufficiently smoked."

Steam Expansion.—The *American Artisan* gives the new table constructed by the celebrated French engineers, Normand and Mallet: In the construction of this table of expansion, corrections have been made for three important points, viz., the fall of temperature to the degrees corresponding to the successive pressures; the portion of condensed steam which, added to the fall of temperature, completes the loss of heat corresponding to the successive supplies of motive power (steam); and for the resisting pressure in the condenser. In the table the first column represents the final volume of steam in the cylinder at the end of its expansion in proportion to the volume just before expansion commences. The second column gives the corresponding "cut-off" point in decimal parts of the stroke. The third column gives the work done by the steam, supposing the work done without expansion and without back pressure to be 1:

1·00	1·000	0.960
1·50	0·666	1·326
2·00	0·500	1·566
2·50	0·400	1·741
3·00	0·333	1·876
4·00	0·250	2·071
5·00	0·200	2·206
6·00	0·166	2·304
8·00	0·125	2·435
10·00	0·100	2·513

Messrs. Normand and Mallet think that the degree of expansion should be in proportion to *the distance run*, in order that economy may result from *the combined lightness of the machinery and fuel.* For a run of one day the rate of expansion should be 4 or 5 volumes; for 5 days, 5 or 6; for 10 days, 6 or 7; for 15 days, 7 or 8; for 20 days, 8 or 10. Expansion to 4 or 5 volumes has been found in Normand's engines to be consistent with the highest degree of lightness even without fuel.

"Something New in Steel."—*The Engineer* of Dec. 25th, describes, under the above head, a new tool metal prepared by Mr. Mushet, which planed a certain area of hard cast iron without losing its edge, while a similar tool of the best ordinary cast steel had to be ground three times to perform the same work. The journal named above, says it is to all intents and purposes, a new metal,—neither steel nor cast iron. Mr. Mushet has not patented its mode of production, although it is reserved as a secret.

The Ejector Condenser.—Morton's condenser, which we described last week, is said to be "regarded by eminent professional men in Great Britain as probably the most important improvement in the steam engine since the time of James Watt."

Scientific Miscellany.

Reversion to Original Types—The Silk-worm Disease.

It is well known that, among men, the strongly marked features of an ancestor, although so modified by transmission through repeated intermarriages with different families, as to have been totally untraceable for several generations, will occasionally "crop out" in all their distinctness; and that an infant, who is by no means "the very image of his father," will look exactly like the picture of his great-great-great-grandfather. Something analogous to this is true of lower organisms. Part V. of Packard's "Guide to the Study of Insects," — which has just come out, and the receipt of which from the publishers we hereby acknowledge,— treats of,—among other families, — the *Bombycidæ.* To these belong the silk-worms. A few remarks upon the *Bombyx mori*, or Chinese silk-worm, will at this season be interesting to many of our readers. This worm is of an ashy or cream color; but in almost every batch of worms will be seen, after the first moult has occurred, some dark-colored ones. These have been considered a distinct species, arising from domestication. But the experiments of Captain Hutton, of India, have shown that they are actually types of the original species; and that by separating them from their debilitated and degenerate companions, whose sickly race is fast dying out,— a permanent and healthy breed may be produced. He attributes the disease which has been prevalent among them,—and which has at last brought them, as a family, to a moribund condition,—to improper food, want of light and air, too high a temperature, and constant interbreeding for centuries. Having become convinced that the occasional occurrence of a dark-grey or blackish worm was an effort of nature to revert to the original healthy starting-point, "he picked out all the dark-colored worms and reared them separately, allowing the moths to couple only *inter se*, and the same with the white worms. In the following spring the one batch of eggs produced nearly all dark-brindled worms, whilst the other batch produced white worms, sparingly interspersed with an occasional dark one; these latter were removed into a dark batch, which was also weeded of its pale worms. In the third year the worms were still darker than before, and were always larger and more vigorous than the pale ones, giving larger and better stuffed cocoons. He finally succeeded in getting an entire brood of dark worms, which he regarded as a sign of increased health and strength in the larvæ, thus proving that the dark worms were of the original race."

The Transits of Venus.—Mr. Airy, the Astronomer Royal of England, is already preparing for the transit of Venus, which will occur in 1874. He suggests to the Astronomical Society, as one station from which to make the observations, a point in the Antarctic Continent where Sir James Ross landed. This point, however, is unapproachable at or about the time when the event will take place; those therefore who join the party, must make up their minds to stay there a year. Other points also recommended as stations are Mauritius and Madagascar. Another transit will occur in 1882.

Bathybius.—This is the name given by Professor Huxley to the singular gelatinous substance from the bottom of the Atlantic which he has been investigating by means of the microscope. It is the lowest form of living matter, and apparently obtains its food, like plants, from the inorganic world. By some it is regarded as a gigantic Protozoan, extending over miles of surface, and yet being one living mass.

The Two Toluidines. — Rosonstiehl has found that besides the ordinary crystallizable *toluidine*, there also occurs in association with the aniline of commerce, another *liquid* alkaloid, isomeric with toluidine, which he calls *pseudo toluidine.* Since 1863 Hoffman has taught us that aniline alone will not produce the brilliant tinted salts of rosaniline, but that toluidine must be present also. R. finds that neither species of toluidine alone will act in this way, but that a mixture of both of them behaves with arsenic acid like a mixture of the ordinary crystallized toluidine with aniline, affording the arseniate of rosaniline; but, what is most remarkable, affording it in very much larger proportion. In fact, whilst a mixture of pure crystallizable toluidine with anilino yeilded but 22.5 per cent. of crystallized red color, the mixture of the two toluidines, as obtained from coal tar, yielded 39 to 40 per cent. In the former case, about 20 per cent. of anilino remained unchanged, so that the proportions of toluidine and aniline entering into the reaction were two parts of the former to one of the latter. Commercial aniline, of course a mixture, yields from 27 to 30 per cent. of the color.—*Bulletin de la Société Chimique, Prof. Wurtz.*

To Preserve the Metallic Luster of Sodium.—It is usual to keep sodium under naphtha. But its beautiful metallic luster is in this case only seen upon a freshly cut surface. Prof. G. Hinrichs proposes and practices the following method, by which that luster is permanently shown: "Take two test tubes, one a little smaller than the other, so as to slip into the latter without leaving much space between the two glass walls, put some carefully cleaned sodium in the wider tube, insert the more narrow tube, having previously given a thin coating of beeswax to the upper part of this latter; then gently heat the whole on a sand bath. The sodium will fuse, and by a gentle pressure the inner tube is pressed down, so as to force the fused metal over a large surface between the two tubes, while the air is totally excluded by the beeswax. I have kept sodium for more than six months in this way, and it is now as bright and brilliant as when first put up."

The Granite and Soil of Iowa and New England.—C. A. White has traced up the reddish granite rocks of the Iowa drift to their original home. He says: "At the mouth of the Redwood River there are large exposures of them, reaching a hundred feet in thickness, yet in place and undisturbed, but so thoroughly decomposed, that one can crush it in his hand to the condition of ordinary soil, like that described by Professor Agassiz, as composing the Organ Mountains, near Rio Janeiro. It is evidently from this source that much of the soil and fine material of the drift of Iowa and Minnesota are derived. New England did not derive such a soil from her granites, although they contain all the elements of good soil, because their texture did not allow of their ready disintegration, while the glaciers were passing over them, as those of Minnesota did. Thus the great superiority of the soil of the Northwest over that of New England, is due to the fact that the rocks of the whole region—granites, sandstones, and limestones—were more easily disintegrated and ground."

Paraffine.—The ordinary mode of obtaining refined paraffine from the crude distillates involves two redistillations of the same, which always detracts from the yield of paraffine, both in quantity and quality; a portion being converted into permanently liquid hydrocarbons, while another portion becomes modified so that the solid products are softer and more fusible. Hulmer proposes therefore to treat the crude tarry products directly with sulphuric acid, then, after decantation, to distill from a few hundredths of *quicklime* (instead of the soda ordinarily employed) and then to crystallize, press and purify in the usual way by washing with liquid hydrocarbons. He thus obtains a greater yield and a better product.—*Gas Light Journal.*

Estimating Silver by the Wet Method.—M. Stas says that chloride of sodium does not precipitate all the silver from a solution. He employs bromides; and he is now engaged in experiments on the preparation of bromide free from chloride, as the commercial samples are impure.

Iodide of Aluminum in Photography. M. Jeuffrein states that he has found this substance very useful in preventing the collodionized surface from blistering.

Resources and Developments.

SHARK OIL.—An expedition is being organized, and a vessel fitted out at Honolulu for the purpose of catching sharks, in the waters about Pearl river, Oahu. The oil will he extracted from their livers, and the fins dried for the Chiua trade.

SALT DEPOSIT. — We are informed (says the Virginia City *Enterprise)* tbat a salt plain, some five miles in width by eight in length, has been discovered about eighty-five miles southeast of Pine Grove. The whole surface of the valley is of pure, coarse-grained salt. Near the center of the valley is a pond, a quarter of a mile in diameter, of exceedingly salt and bitter water.

CAPABILITIES OF UTAH TERRITORY.—According to George A. Smith, who is said to be the best informed man in the Territory, and is called the historian of the church, out of the 43,000,000 acres of land in Utah, not more than 500,000 can be cultivated with profit. Last year, the number of acres was 133,000, or about one-third of the land which can be cultivated, by irrigation from mountain streams. Artesian wells may he made successful on the sage plains and the alkali wastes. Several attempts have been made to sink them, but without great success thus far. A company was formed several years ago, called the Jordan Irrigating Company, which undertook to irrigate about 11,000 acres of land west of the city. An expensive dam was erected, $20,000 expended, hut the floods carried away the dam, and not more than 500 acres have been brought under cultivation. In the statistical report made to the Territorial Legislature, it is estimated that the tillable land not yet under cultivation will support a population of 400,000. This estimate gives 640 inhabitants to the square mile, a population more dense than any State in the Union. The farmers of Utah have small farms—not more than fiftecu acres. The average may be set at ten acres. Irrigation is practiced, but it is expensive, requiring a net work of ditches and dykes. The water is taken by a sluice from main canals, and hrought upon the growing crops through shallow ditches, generally about five feet apart.

SOUTHERN UTAH has a flourishing settlement of about 10,000 faithful Mormons, in the rich valley of Virgin river, a tributary of the Colorado, ahout 75 miles above its mouth, which is near Colville. The principal town is St. George, situated at an elevation of about 2,000 feet above the sea, in latitude 37° 10′. The climate is very warm in summer, and the winters are much milder than in Salt Lake City, which is 3½ degrees further north and 2,300 feet higher in altitude. The cultivation of the cotton, tbe grape, the fig, the olive and various other semi-tropical fruits, having proved successful, many of the Mormons of the colder basin intend to move to the south. Washington county includes the new settlements; it has a mill in which cotton and wool are spun and wove, nine grist mills, six saw mills, and twenty-two schools. St. George is now building a meeting house of cut stone, to cost $300,000. Wages range from $2 50 to $6 per day in currency, hut money is very scarce, and nearly all the trading is done by barter. It is probahle that tbe opening of the White Pine mines will furnish a splendid market for the produce of St. George, which is 175 miles distant, and only 120 from the Grand District —a later discovery, said to be very rich also. Among the institutions of St. George is a coöperative commercial association, the agent of which is now in this city purchasing merchandise to be shipped to San Pedro, and theuce hauled overland, at an expense of 15 cents per pound. Transportation would be cheaper by way of the Colorado, but trips to the head of navigation at present are very costly, so that small shipments of freight to Southern Utah can be carried cheaper by way of San Bernardino.

ACCESSIBILITY OF THE UPPER COLORADO BASIN. — Ross Browne speaks thus of the Colorado, as he saw it: "It could scarcely fall any lower, without going entirely through its own bottom. A more capricious river does not exist. Formerly it ran through the desert to the northwest, but for some reason or other it changed its course, and it now runs ahout three feet above the level of the desert. As a navigable stream it possesses some advantages during the dry season; boats cau seldom sink in it; and for the matter of chanuels it has an unusual variety. The main chauuel shifts so often tbat the most skillful pilot always knows where it is not to hc found by pursuing the course of his last trip. The steamer which plies hetween the fort and the mouth of the river, distant 100 miles, could not make the round trip in less than two weeks, owing to shoals and shifting bars. Up to La Paz and Fort Mojave the navigation was still worse. Twenty or thirty days up and down was considered a fair trip." Colville, the landing point for White Pine and St. George, is 75 miles above Fort Mojave. In time it is possible that a canal, for freightiug and irrigating purposes, may he built from Colville to the head of economical navigation.

Railroad Items.

THE last rail has been laid on the San José and Gilroy Railroad.

THE citizens of San Rafael, Marin County, are taking stock and moving actively iu a railroad building project to connect that town with Point San Quentin ferry landing, four miles distant.

THE Watsonville *Pajaronian*, of Fehruary 11th, says: Seventy-five tbousand dollars has already been subscribed for the purpose of building a railroad between Santa Cruz and Salinas Valley.

THE highest altitude attained on the Central Pacific Railroad is 7,042 feet. The highest point on the Union Pacific Railroad is at Sherman, which is 8,434 fect above the level of the sea.

WORK on the Virginia and Truckee Railroad was commenced at Virginia City ou Thursday the 18th inst., aud the telegraph says it is to he prosecuted with the utmost onergy until its completiou.

SALT LAKE CITY is now within four days of Chicago by rail and stage. Wells, Fargo & Co's express stages connect with the Union Pacific Railroad at Cranton, less thau one hundred miles from Salt Lake, aud ahout twenty-four hours' journey.

THE Engineer Corps of the California Pacific Railroad, in charge of F. H. Petersou, completed their survey to Woodland, Yolo County, on Thursday, February 18th. From Davisville they report the ground in good condition for grading, and work is to commence on the Davisville end of the line immediately.

THE Solano *Democrat*, of February 13th, says: From present appearances it is fair to presume that Woodland will soon be in direct communication by rail with Vallejo and Sacramento. It is reported that the contract has been let for the construction of the road from the junction at Davisville to this place.

A CORRESPONDENT from the national capital writes: The Washingtou Territory people want a railroad, with all its dips, spurs and angles, to accommodate the growing trade of that Territory. The Oregonians here are divided in their efforts between two rival roads. The Idaho folks favor a railroad to Snake River, and all these, united with the Moutana, Minnesota and Dacotah people, are urging upon Congress the speedy construction of the Northern Pacific Railroad.

THE Yreka *Journal* thinks that if Congress refuses to pass the Mallory bill, the California and Oregon Railroad Company will then be compelled to huild its road on the line of the old Elliot survey.

On this subject the Shasta *Courier*, of February 15th, says: We cannot see why it will be compelled to do so. The charter granted to the company by Congress merely stipulates that the road shall be built from a giveu point iu the Sacramento Valley to the Oregon line. The company is not restricted to the Elliot survey, but is at liberty to run to the Oregon line hy any route it may see proper to adopt. The company has already located its lands to a point about six miles west of this place, rendering it certain that wheu the road is built it will at least come iu the neighborhood of this place, if not directly to the town. It is yet to be determined whether the Elliot survey will be followed up the Sacrameuto and through Shasta Valley, or the road turn off and ruu up Pitt River Valley, and reach the Oregon line through the Goose Lake country.

THE UNION PACIFIC TOWN AT SALT LAKE.—The new towu laid out by the Uuion Pacific Railroad Compauy in Salt Lake Valley, is located about six miles north of Ogden, at the Prairie House. The location is not so good, on account of water and the river navigation, as the point where the road crosses Bear River. Steamers can ply on the lake and up the river to the latter point.

"After laying out the new town," says the Salt Lake *Reporter*, "the railroad company received au offer from the Mormon authorities that if they would make that location in the city of Ogden, huilding their machine shops there, those authorities would donate to the company three hundred acres of land in the limits of that city and a houus of $100,000. This was the proposition, and the agent did not feel at liberty to go on with the sale of lots till it was decided. Whether it will be accepted remains to be seen."

ON the Western Pacific Railroad the track is laid on the Sacramento and Stockton section to the Cosumnes River, a distance of twenty miles. Tho survey is completed, and the grade lines established from the San Joaquin plains to Livermore Valley, a distance of fourteen miles. Over this sectiou also, a majority of tbe culverts are finished. Pile drivers aro at work on the fouudation for the bridge across the Cosumnes River, and timber for a bridge over the San Joaquin (old river) is ready at Banty's. About 700 men are engaged upon the cuts and tunnel at Livermore Pass. The tunnel is in 226 feet, and will be ahout 1,200 feet long, through a fine sandstone. This rock is valuahle for building purposes, and will, it is thought, be extensively quarried and freighted when the railroad is completed. Gangs of laborers are running the tunnel from each end, and will meet before July. It is to be timbered throughout. From Ladd's store, in Livermore Valley, to Oakland, a distauce of twenty-eight or thirty miles, three surveys have been made —oue to Hayward's, one to Castro Valley, and one coming out at Ward's milk ranch, at San Leandro. Neither survey has been adopted, though the last survey is said to he most favorably considered, with a possibility that still another route, through Hayward's Pass, may be adopted. Probably the company will find it advantageous to run freight trains arouud the bay to reach Sau Francisco without ferriage.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING JANUARY 26th.

86,273.—IMPROVEMENT IN PUMP DEVICES FOR STEAM AND OTHER ENGINERY.—Chas. Edward Blake, San Francisco, Cal.:

1. I claim the safety valve apparatus A, B, C, D, E, F, G, constructed and arranged to operate substantially as set forth.

2. I claim the arrangement of the devices A, B, C, G, F, E and I, with reference to a steam pump or other enginery, as set forth.

New Inventions.

RUSSIAN WEAPON.—A Berlin journal announces that a Russian officer of St. Petersburg has invented a new firearm, which can be fired off two hundred times per minute, will fill a space of thirty paces square with a shower of grape shot, aud will produce its effects at a distance of 2,400 paces.

STEAM CONDENSER FOR USE ON SALT LAKE. The editor of a Salt Lake paper says: We saw yesterday, in front of Wells, Fargo & Co.'s express office, a most ingenions and economical steam condeuser, the invention, we believe, of General P. E. Connor, of Salk Lake, which is to be applied to a steamer he has lately had constructed on Great Salt Lake. The condenser consists of two coils of copper pipe which receive the escape steam from the cylinders, and are so placed as to he exposed to the spray from the paddle-wheels, and thus continuously producing a shower on the pipe, cooling it and condensing the steam, and thereby returning the water for use in the boiler. The water of Salt Lake is too strongly impregnated with saline matter to he used successfully for steam purposes, and therefore this contrivance, or invention, is found necessary to obviate the portage of fresh water and make the navigation of the lake practicable.

STEAM PLEASURE TRAINS ON ICE.—A company has been formed at St. Petersburg for the introduction of steam traction for pleasure trains on ice. It is proposed to employ locomotives like those on the railways, of about twenty-five or thirty horse power, with this single difference—that the wheelties are to be channeled in order to make them bite upon the ice without sensibly injuring it. The slipping of the wheels beiug avoided, and a snow-plow attached in front of the train, it is believed that it will be found practicable to make long journeys to Finland, Lapland, and some of the islands blocked up iu winter by the ice. The plan is well supported, aud it is thought that such means of communication may give life to countries which are now shut out from intercourse during the whole winter.

THE MOUNT DIABLO COUNTRY.—Our agent, William H. Murray, is making the tour of the coal mines, via Livermore Pass.

NEW INCORPORATIONS.—Articles of incorporation have heen recently filed in the County Clerk's office in this city as follows:

MIANTONOMAH MINING CO.—White Pine, Nev. Feb. 5th. Capital stock, $480,000; 4,800 shares, $100 each. Trustees: F. E. Thomas, James Alger, M. Steppacher, A. Pollak and J. P. Sherburne.

MAGENTO MINING CO.—White Pine, Nev. Feb. 8th. Capital stock, $1,400,000; 14,000 shares, $100 each. Trustees: W. K. Deitrich, Henry Cassanova, Peter Taylor, Edwin C. Palmer and W. J. Stringer.

OMEGA S. M. CO.—White Pine, Nev. Feb. 12th. Capital stock, $800,000; 8,000 shares, $100 each. Trustees: R. E. Brewster, Robert Apple, A. S. Gould, T. A, Mudge and Chas. Buneman.

TITICACA S. M. CO.—White Pine, Nev. Feb. 16th. Capital stock, $1,200,000; 12,000 shares, $100 cach Trustees: James Strattou, Cyrus N. Bradley, W. J. Tilley, G. N. Russell and Thos. Rea.

ION MINING CO.—White Pine, Nevada. Feb. 13th. Capital stock, $1,400,000; 14,000 shares, $100 each. Trustees: Peter Taylor, W. K. Dietrich, H. Cassanova, W. W. Merrihew and E. Applegarth.

PENNSYLVANIA TUNNEL CO.—White Pine, Nev. Feb. 13th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: J. L. Howard, R. W. Heath, J. T. Boyd R. F. Morrison and E. W. Leonard.

SAN FRANCISCO PACKAGE EXPRESS CO.—San Francisco. Feb. 13th, Capital stock, $2,000; 40 shares, $50 each. Trustees: D. V. B. Henarie, John G. Hodge, George Schultze, W. W. I. Kip, Jr., Edward Bosqui, David R. Patten, E. L. Goldstein, S. E. Oakley, A. D. Grimwood, T. A. Mudge, T. W. Fenn and H. B. Murray.

KAWANEE S. M. CO.—White Pine, Nev. Capital stock, $4,000,000; 8,000 shares, $500 each. Trustees: O. S. Dawson, H. B. Murray, W. I. Kipp, James Laidlcy and Edward Barry.

CITY GAS CO.—San Francisco. Feb. 16th. Capital stock, $10,000,000, 100,000 shares, $100 each. Trustees: A. Hayward, Thos. Bell, S. F. Butterworth, Nicholas Luning, I. Friedlander, Lloyd Tevis and Henry C. Robinson.

ETNA MINING CO.—Nevada, Feb. 18th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: Peleg Bumpez, Jas. A. Pritchard, James O'Neill, John Gillig and John Nightinga'e.

EDITH S. M. CO.—Nevada. Feb. 18th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: J. Gillig, J. D. Littlefield, J. Nightingale, B. F. Sherwood and J. O'Neill.

WELLS MINING CO.—White Pine, Nev. Feb. 5th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: Otis V. Sawyer, J. H. H. Williams, Wright Le Roy, Geo. B. Merrill and S. P. Wells.

RAVEN S. M. CO.—White Pine, Nevada. Capital stock, $800,000; 8,000 shares, $100 each. Trustees: C. W. Fox, E. O. F. Hastings, Joseph Clark, M. J. McDonald and C. F. Fargo.

MAMMOTH S. M. CO.—White Piue, Nev. Capital stock, $3,600,000; 3,600 shares, $1,000 each. Trustees: J. W. Winter, John Sime, B. F. Hastings, B. F. Sherwood, C. W. Jones, H. Beachy and W. J. McDonald.

WILLIAM PENN G. & S. M. CO.—Grass Valley, Nevada County. Capital stock, $170,000; 1,700 shares, $100 each. Trustees: B. McAuley, Oliver Sweeney, James Ferguson, P. G. Bonivert and Isaac J. Sherman.

PESCADERO AND HALF MOON BAY TELEGRAPH CO.—Capital stock, $6,000; 120 shares, $50 each.

ELECTION OF OFFICERS.—ODD FELLOWS SAVINGS BANK.—Feb. 9th; Directors: Dr. John F. Morse, John Cammet, Henry B. Brooks, Daniel McLaren, David Hunter, Lewis Soher, John J. Hucks, Philo White, Chas. N. Fox, Geo. T. Bohen, C. M. Boyd, Alfred S. Iredale, Chas. Bernard, Abram Block, Moses Selig, Joseph Brandenstein, Benjamin Price, Benjamin Hagan, S. E. C. Swezey, James Pollock, David Meeker, Albert S. Baldwin and Chas. Metzler.

CALIFORNIA MUTUAL LIFE INSURANCE CO. San Francisco, Feh. 11th. President, Frank McCoppin; Vice-President, S. F. Butterworth; Secretary, John Crockett; General Agent, Wm. R. Wheaton; Medical Examiuers, R. T. Maxwell and J. C. Shorb.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, February 20, 1869.

Financial.

Appended will he found a decision on the subject of Custom House fees, as very recently rendered hy the Secretary of the Treasury, and just received here. It completely sets aside all doubts on the subject, and affords a certain guide to onr mercantile men on a point which has long been mooted without arriving at a definite conclusion:

SIR: The undersigned would beg respectfully to present to you the following facts:

The Collector of Customs at this port (assuming authority under circulars of Custom House fees, dated Dec. 12, 1868) requires the following fees to be paid: First—For delivery of merchandise from appraisers' stores, after examination by appraisers to importers, 20 cents. Second—Transfer permit from appraisers' stores to bonded warehouses, after examination by appraisers, 20 cents. Third—Oath attached to entries of merchandise of all kinds, 20 cents. Fourth—Entries of merchandise warehoused, rewarehoused, withdrawals from warehouse for consumption, transportation and exportation, indepedent of all charges for permits, &c., 25 cents.

Apprehending the collector is at fault in his interpretation of your circular, and respectfully calling your attention to the fact that goods are sent to the appraisers' stores for examination by Custom House officials, and not at the request of importers. Same examination applying to merchandise bonded. Transfer permits being required.

The charge of twenty-five cents on all entries under warehouse laws, while cash entries are exempt from any charges other than the regular and customary fees for permit delivery, invoices and bonds. With respect your obedient servants.

LARZELERE HUCHEY,
E. H. DAILEY,
Custom House Brokers.

To Hon. HUGH MCCULLOCH, Secretary of Treasury, Washington, D. C.

TREASURY DEPARTMENT, Jan. 16, 1868.

SIR: Your communication of the 28th ultimo is received, transmitting a letter dated the 22d ultimo from Messrs. Larzelere & Huchey and others, complaining of your action, under authority as alleged of Department Circular of the 12th ultimo, in requiring the following specified fees to be paid at your port, viz: First—For permit for delivery of merchandise from appraisers' stores, after examination by appraisers to importer, 20 cents. Second—For transfer permit from appraisers' stores to bonded warehouse, after examination by appraisers, 20 cents. Third—For oaths attached to entries of merchandise of all kinds, 20 cents. Fourth—For entries of merchandise, warehoused re-warehoused, withdrawals from warehouse for consumption, transportation and exportation, independent of all charges for permits, &c., 25 cents.

After duly considering the matter, I am of opinion that, so far as the fees specified in the first and second charges are concerned, your action therein is not warranted by the provisions of the circular to which you refer. The orders for the delivery of examined packages from the appraisers' stores cannot be considered as "permits," for they issue as a matter of course and, without any application therefor being made by the importer, and are merely incidental to the examination of the merchandise, which is done entirely in the interests of the Government. You will, therefore, discontinue the practice of collecting the fee specified in the first and second charges. The fee of twenty cents for the oath attached to entries of merchandise of all kinds, as specified in the third charge, is correct and proper, and is in accordance with the requirements of the said circular. See the first paragraph on the third page thereof.

In regard to the fee of twenty-five cents for entries of merchandise warehoused, rewarehoused, &c., specified in the fourth charge, which you allege you require to be paid under the provisions of the fourth line from the bottom of the first page of said circular, you are informed that said line was inserted therein through a clerical error, and that it will accordingly he considered by you as canceled and of no effect. The practice of collecting said fee will therefore he discontinued by you.

I am, very respectfully,
HUGH MCCULLOCH,
Secretary of the Treasury.

To J. W. CAKE, Esq., Collector of Customs, Philadelphia, Penn.

The announcement of a sale of $1,000,000 of gold by the Assistant U. S. Treasurer of this city on the 23d instant, selling $250,000 on that day, and a like amount on every third day thereafter, has produced great activity and a sharp advance in Legal Tenders, the selling rate, on the street, in snch amounts as our rather limited market afforded, being 75@76 cents.

City Stocks.

The sales of miscellaneous stocks in the Board, during the past week, have been confined to Spring Valley Water and San Francisco Gas. The former sold at $68@68 50 per share, while the latter shows a very heavy decline, selling at $80, against $90 the previons week, and reported private sales at $92. This fall is due to the incorporation of a new company, which filed its certificate in the County Conrt on the 13th inst., nnder the name of City Gas Company, with a capital stock of $10,000,000, divided into 100,000 shares, naming as Trnstees—Nicholas Luning, (snbsequently elected President of the company) A. Hayward, Thomas Bell, S. F. Butterworth, I. Friedlander, Lloyd Tevis and Henry C. Robinson. This company gives assurances of immediately commencing active operations, and the pnblic are already showing an appreciative interest in this laudable undertaking by petitioning the Board of Supervisors to extend the contract for lighting the city to a mnch less number of years than contemplated by the Committee which has the matter in charge.

Mining Share Market.

The mining share market exhibited increased vitality since our last similar reference, and at the closo most leading stocks show an improvement, and this advance seems to be based upon an apparently healthier condition of the market, which is predicated upon a more hopeful condition of the various claims on the Comstock lode. As to the White Pine district, the filing in our County Court of certificates of incorporated companies located in that region are augmenting very rapidly, no less than eight companies having recorded their certificates on the 18th instant. In this respect the Board of Brokers have adopted an excellent rule as regards new stock companies. They require the examination of the merits of the company hy a committee, and a payment of $500 instead of $100 as heretofore will have to be made before any company will he placed on the Board lst.

Reports from White Pine give the most glowing descriptions of the mineral wealth of that region, and its great extent. Despito storms, deep snows and extreme cold, large numbers are flocking to White Pine on every available occnsion. This wondrons belt forms part of the State characterized by Senator Sanlshnry as heing inhabited by "howling animals!" It is possible that the gentleman himself would not hesitato to utter a howl over the richest silver regions ever discovered.

BELCHER—sold within a range of $34@29 50, and closed at $30. The ore fonnd on the 200 level is reported to promiso well, and from present appearances of the mine it is believed they can get along without another assessment. On the 11th instant their liabilities amounted to $10,000.

CHOLLAR-POTOSI—declined from $170 to $165, and at the close realized $167. Dnring tho week ending February 12th 716 tons of ore were extracted. On the 11th inst. $11,279 in bullion was sent forward to the office in this city. Nothing important in relation to the mine.

CROWN POINT—receded from $68 50 to $65 50, and closed at $66 75....GOULD & CURRY has heen in the market at $109@106 50. The construction of the Truckee railroad will bring into the market thonsands of tons of low grade ore found in this mine, which it is thonght can then be worked with profit. Otherwise nothing special.

HALE & NORCROSS—has been in active demand at a material advance, rising to $99 on the 18th, and closing at $86. On the 17th instant they reached some good ore on the lowest level, which is reported to be at least seven feet wide, bnt what it may lead to is yet to be ascertained. ....KENTUCK declined from $231 to $218, improved to $224, and closed at $218. The first shipment of bullion on February acconnt amounted to $10,350 72.

IEPERIAL—has been quite active, declining from $125 to $104, and closing at $110. A telegram of Fehrnary 19th states that tho 1,000 level drift shows no change, and on the 1,100 level they are in barren quartz with an increase of water. The bullion so far received on February acconnt aggregates $16,255, against $19,464 same time in Jannary.

OPHIR—sold at $44 50@40, closing at $41. The shaft has been sunk to a depth of 730 feet. On the 17th instant tho pnmp with all its connections was in place, and they expected to start the machinery on the 18th, by which they would soon be enabled to prosecute drifting in a vigorons manner....SIERRA NEVADA sold at $25@21. For February account the bullion, so far, foots np $1,800. John Ferrie is now Secretary of this company, and the office is at 409½ California street....SEGREGATED BELCHER sold to a very large extent, improving from $9 25 to $12 25, and closing at $12. It is possible that the ore fonnd on the 200 level of the Belcher company may extend into the gronnd of this company at the 220 level.

AMADOR (Cal.) sold at $272 50. The first cleanup of this company in February will yield about $32,000, and for the whole month will probably reach $60,000. As near as the rock from the Badger shaft can he valned it prodnced $60 to the ton....GOLDEN CHARIOT (Idaho) sold at $40@50. Upwards of $28,000 has been received in hnllion on Jannary account. A dividend of $2 50 is payable to-day (20th.)....SAVAGE sold to a very large extent, improvivg from $62 50 to $72 50, and closing at $67 75.....YELLOW JACKET has been in good demand, selling within a range of $77@67 per share, and closing at $69

MINERAL RESOURCES. — The report of Rossitor W. Raymond on the mineral resources of the States and Territories west of the Rocky Mountains, has been sent in, referred to the Committee on Mines and Mining of the House of Representatives, and ordered to be printed.

MINING CARS FOR WHITE PINE.—A shop on Fourth street is manufacturing a largo number of small mining cars for hoisting ores, to fill an order from White Pine. As fast as they are completed they are piled up near the street, and labelled "For Whito Pine."

"BY THIS SIGN YE SHALL CONQUER."—When the Emperor Constatine adopted his famous hattle symhol, he wrote beneath it *in hoc signo vinces*—"By this sign ye shall conquer." Tho same inscription might properly be affixed to another sign which is the symbol of thonsands of snccessful battles with the bodily ailments of mankind. "S. T. 1860 X," the trade mark of the famons PLANTATION BITTERS, typifies more victories than Constantine the Great ever dreamed of. Victories over dyspepsia, nervonsness, general debility, bilionsness, fever and ague, remittent fever, despondency, constitntional weakness, and a hundred other disorders and disabilities of hoth sexes to which tho heathen assailants of the Eastern Emperor were a mere baga'e'le. Whenever an invalid sees the emhlem, let him take the hint it is intended to give him, purchase the elixir, and conqner his complaint.

Mining Summary.

The following information is gleaned mostly from Journals published in the interior, in close proximity to the mines mentioned.

Our annual storm has come and passed, leaving its traces wherever its effects were felt. What damage was done to the mining interest in the different counties in the State, we have as yet been unable to learn, as but few of our weekly exchanges have come to hand, owing to the bad state in which the roads have been left by the storm, which fact will account for the meagreness of our weekly Summary in this issue.

CALIFORNIA.

AMADOR COUNTY.

Jackson *Ledger*, Feb. 13th: We are informed that Mr. Hutchings—who is acting as agent for a large company of San Francisco capitalists—contemplates erecting a quartz mill near Ione City, where it is said a good lead of quartz has been recently discovered.

In an article headed "Home Matters," the editor inveighs against the practice of capitalists sending their money outside of the State for investment in undeveloped and uncertain mines. He says: In this county there are numerous lodes only partially prospected that if fully developed would prove permanent paying mines; yet for the want of means the owners have been compelled to suspend work upon them, and they now lie idle, useless and undeveloped. If only a small portion of the money sent from the State to White Pine, was made to prove the partially developed lodes, we would doubtless have an addition to our paying ledges that would place this county in the foremost ranks of mining localities. The ledges about Pine Grove are evidently, many of them, of great value, judging from the yield as far as proven. This range, or system of ledges, has been greatly overlooked; quartz men from abroad deeming ledges outside of the Amador belt as unworthy of their attention. This is a great mistake. No mines in the county as far down as proven, have yielded richer average rock than the ledges in and around Pine Grove; and wherever this belt has been struck, it has given undoubted evidence of its ultimate value. There is no doubt but that this belt is but a continuation of the Grass Valley lodes in Nevada County; the characteristics of the rich rock in the two localities are the same, and free gold is as abundant almost in the Pine Grove ledges at the same depth, as in those of Grass Valley. Railroad Flat, in Calaveras County, is also a continuation of the same ledges, and the recent discoveries made in the last named locality, bear strong resemblance to those at Pine Grove. Within this belt are situated the Union, Pauch and Stevenson mines, all of which, as far as prospected, have given flattering evidence of their real value. Higher up in the same belt is the Tellurium, Craft, Vaughn and Pleasant Valley mines, all of which have been only partially developed, and yet each one for the amount of work done on them, has yielded as rich average rock as the most valuable mines in the county. All these ledges are lying idle for the want of means on the part of the owners to prosecute further work upon them. The most of these mines could be purchased at low figures compared with the flattering indications given.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, Feb. 13th: The late storm was by far the most severe of the season. Mokelumne Hill looked like a vast mortar bed. The streams are badly swollen, but we have heard of no serious damage resulting from the storm, with the exception of the caving of the tunnel which conveys the water through the ridge between here and Happy Valley.

There is no abatement of the excitement concerning the recent discoveries in Railroad Flat. Work is progressing favorably, despite the bad weather, and prospectors are making new strikes and locating claims.

At West Point times have been rather dull during the past season. Quartz mining has not been so remunerative as formerly, and less work has been done than for years previous. The absence of machinery for pumping out the water invariably found at a certain depth, has always been seriously felt, and is the principal cause of the lassitude being evinced. Milling facilities superior to those enjoyed by other localities are at the service of the West Pointers, but the great difficulty is in obtaining the rock. We are informed that efforts will be made, the coming season, to obviate the difficulty. From the vicinity of Murphys, Angels, and other portions of the county, the mining intelligence is encouraging. Mills are springing up, and labor is being prosecuted with energy.

A correspondent writing from Monitor Camp, says: There will be much prospecting done here the coming spring and summer. We have one of the finest looking ledges in the county, running from Mr. Beal's ranch on the north, through Lava Mountain, and passing near Monitor Camp, through Central Hill and across the Calaveras River to Bear Mountain. It is supposed to be a continuation of the Lower Rich Gulch lead, and has every indication of being a paying ledge. About the only place from which a pound of rock has been taken, is upon the claim of Davis, Fullock & Co., on Central Hill; at this point it is said to prospect well. They have a shaft 40 feet in depth, and a large, fine looking ledge. They will resume labor upon their shaft as soon as the weather settles and the rainy season is over.

The boys are all very busy at present, washing their dirt with free water,—a privilege they do not often enjoy in this camp.

INYO COUNTY.

Los Angeles *News*, Feb. 6th: The Cerro Gordo mine is turning out about four tons of bullion per day.

The Queen City mine in Lone Pone district has been found to have a lode of nine feet in width, and is reported to be one of the richest mines in the world.

Fourteen thousand pounds of bullion arrived in this city yesterday in charge of Gray Bros. & Arcado, from the Cerro Gordo mine. Three other trains are upon the road with 15,000 pounds from the same mine, and 20,000 pounds more is being shipped by ox teams. There is said to be now 60,000 pounds at the mines for shipment to this city. The bullion is said to contain silver, lead and copper, yielding about 25 cents of silver to the pound of bullion.

The attention of miners and the citizens of Los Angeles generally, has been attracted during the past year by the frequent and in many instances, heavy shipments to this city, from the Owens' River country, of silver bars, and now they all have an opportunity to judge of the mines from which this large amount of silver bars has come, by examining the great variety of ores from the Cerro Gordo mines, in the Lone Pine district, which are now on exhibition in this city. Those on exhibition have been pronounced here as the richest specimens of that class of ores that have been presented in a body as the result of one mining district, ever shown on this or any part of the Pacific Coast.

MARIPOSA COUNTY.

Mail, Feb. 12th: Geo. W. Payne, owner of a quartz vein situated on Specimen Gulch, near the town of Colorado, some two weeks since, struck a pocket which yielded him 72 ounces of pure gold; since which time a piece of eleven ounces, and other scattering gold, has been found. Mr. Payne has, at intervals for five years past, been prospecting this vein, which now promises to him a rich reward for his past labor.

It is reported that the Mariposa Co. is about to commence operation on the quartz mine which is situated at the lower end of the town of Mariposa. There is upon the mine a portion of the 50-stamp mill, which was built several years ago.

Gazette, Feb. 12th: During the past week two enterprising Indians have been scraping up the dirt for two or three inches in front of old store sites, and taking it down to the creek and panning it out. They have averaged $4 or $5 a day for their labor.

The owners of the Maggie Russell mine, situated near the Merced river, are about to enter into a contract to sink a shaft 100 feet, and the contractors to take out 1,000 tons of quartz ore. This mine prospects well, and the owners anticipate heavy dividends when it is fairly opened and thoroughly developed.

Our imp, while on his way to dinner yesterday, in deep thought as to how the new roller would work, suddenly spied something shining on the ground, and immediately "went after" it, and after washing the mud off, it turned out to be a piece of quartz "lousy with gold."

Mr. G. W. Payne made a very lucky strike a few days since near Colorado. He took out about $2,000 in a short time, and among the lot of specimens found by him are some as pretty as one would wish to see.

NEVADA COUNTY.

Transcript, Feb. 9th: Keith & Co. have located five claims of 100 feet each on Greenhorn creek. The claims commence at Osborne Ravine, and extend down the creek to the falls below.

The 40-stamp mill at the Star Spangled Banner mine, is to have another battery of ten stamps added as soon as the lumber can be gotten on the ground. The lead is so large and the mine so thoroughly opened, that rock can be obtained faster than 40 stamps can reduce it. The mammoth rock breaker can break the ore fast enough to keep the 50 stamps in operation constantly. In order to put up the additional battery, it will not be necessary to suspend work, and the mill will continue in operation. In the recent improvements the building was sufficiently enlarged for 50 stamps, so that all that remains to be done is to put them in place. When the new battery is added, the Banner mill will be 20 stamps larger than any other mill in the county, and one of the largest in the State.

Feb. 10th: A project is now on foot to get an outlet for the extensive range of rich ground extending from Badger Hill to Columbia Hill, from the middle Yuba. The parties undertaking this work are Mills, McMurry, Cook and Hunter. They propose to commence 100 feet from the river, and run a bed rock tunnel 1,900 feet to Badger Hill. By this tunnel they will be able to clean up to the bottom for three miles, and to wash off one of the richest ranges on the coast. It is estimated that the enterprise will cost in the neighborhood of $80,000.

The company engaged in mining at Relief Hill have been running for the channel for three or four years, and expended a large amount of money in prospecting. About three weeks ago the Welsh Co. succeeded in striking the channel, and since that time this company has been taking out an average of $12 per day to the man. Quite a large number of companies are at work, and they have been greatly encouraged by the success of this company. Relief Hill is destined soon to become a prosperous mining camp.

Gazette, Feb. 9th: English & Wells report five and a half feet of snow on Bloody Run Hill, between Moore's Flat and Lake City, yesterday.

Daniel McCarty and 12 other men came out from Eureka to Humbug, yesterday, on snow-shoes. McCarty reports the snow 8 feet deep at Eureka, and 10 miles above that point, near the head of Cañon creek, it is between 15 and 20 feet deep.

Grass Valley *National*, Feb. 8th: The proprietors of the William Penn mine, situated east of Grass Valley, have let a contract to sink on the ledge to a depth of 100 feet for the sum of $1,850.

Grass Valley *Union*, Feb. 9th: Yesterday Henry Scaddon struck good-looking rock in the shaft he is sinking on Union Hill.

Feb. 10th: The constant storms of the last four or five days have prevented the outside prospectors from doing a great deal of work, but at the mills, and where there are sheds to work under, mining is very lively. The spring will be in all probability a backward one, and consequently many mining enterprises will be slow in starting.

The North Star Co. is taking out very rich rock, the gold running through it in the most beautiful sheets. Yesterday, the richest ore which has ever come out of that mine was brought to the surface.

The O'Connor mine is being worked, and some excellent pay rock has been brought to the surface.

Last evening, we went into Wells, Fargo & Co.'s office, and took a look at a couple of gold bricks which came from the Eureka mine. The bricks were the result of two weeks' run, and were shipped at a valuation of $20,000.

EXCELSIOR.—*Gazette*, Feb. 9th: A gentleman from Meadow Lake informs us that the snow at that place on Sunday morning was ten feet on the average, and more falling rapidly.

Transcript, Feb. 13th: The large reservoir of the South Yuba Canal Co., at Blue Tent, broke on Wednesday morning. A gap of fifteen or twenty feet was made in the large embankment, and the water went out with a terrible rush, sweeping everything before it. The reservoirs of the Golden Hill Co. were broken, and considerable damage done to the flumes of Sailor Flat companies.

Gazette, Feb. 15th: The North Bloomfield Gravel Co. expect to employ 100 men and 15 pipes in their claims as soon as they can get the latter in readiness.

Grass Valley *Union*, Feb. 14th: The Graniteville correspondent writes: At Graniteville business is rather dull at this season, but few of the quartz mills running. The Birchville is running upon their own rock and yielding finely. The small supply of wood which they have on hand will be the only reason that will compel them to discontinue crushing. Veatch & Powell of the Erie (more familiarly known as the Jim Crack mine), are running upon rock taken from their mine, and is one of the best paying mines in the district. Black & Loring's mill is running upon rock from the Banberry & Stacey ledge. This rock averages well, and regularly pays a good dividend to the owners. Clark & Poquillion's mill, just above town, is idle at present, but will start in the spring upon custom rock. Business will open lively in the spring, as the North Bloomfield Co. will continue their line of works, and will employ a large number of men, whose trade will naturally come to Graniteville.

At Snow Point mining has entirely ceased, owing to the severity of the winter. There are some very valuable gravel claims here, which will be opened in the spring. At Orleans Flat, Wm. Oberman has been at work getting a set of claims ready to start up in good order as soon as the season will allow. At Moore's Flat the Eagle Co. are raising a shaft in their diggings, and will commence early in the season to wash their rich gravel. This claim is considered the best one on the Flat. The Piute Co. have sold their grounds to a Chinese Co. In former years this claim paid very richly. Hickey's, as well as the Illinois Co., have suspended operations for the season. The St. Lawrence has been sold to a Chinese Co., and will give them a good return for their outlay. Knotwell & Atwater, of the Paradise claim, made a fine run as the closing one for the winter, and will commence in the spring with a fine prospect of making a good summer's work. Business is quiet at Moore's Flat this winter, in consequence of the claims mostly being idle. At Wolsey's Flat mining has closed for the winter. At Bloomfield matters look more lively, as there are many waiting for the North Bloomfield Gravel Co. to commence working their claims.

PLACER COUNTY.

Auburn *Herald*, Feb. 13th: The Colfax correspondent writes: Quartz mining is still being carried on with renewed activity. The Rising Sun Co., the pioneer mill in this district, has undergone great improvements in the last three months. Increased and expensive machinery has been added, and they are sinking their shaft still deeper. At the depth of 180 feet, the ledge offers inducements to still sink, and the company possess the energy and means to prosecute the work systematically.

The Montana Co. has determined to prospect on an extensive scale. From tests already had from their claim, they feel justified in expending some thousands of dollars in sinking on their ledge. They have held a meeting lately, and will have machinery on the ground in a short time.

PLUMAS COUNTY.

Quincy *National*, Feb. 6th: A gentleman from the North Fork informs us that Thompson & Mather have struck some rich diggings in the mountain above Carrihoo on the North Fork. They are averaging $6 a day to the hand, with a rocker, also that Buck Lamb has discovered diggings higher up, that pay equally well. Also that E. R. Drake has good prospects in the same locality.

Bryan & Boston at the old Bamboo claims on North Fork are engaged in cutting a large race, intending to turn the river in the spring.

From Cherokee we have the following items: White & Steward, have recently discovered a very rich quartz ledge, near Cherokee, not far from the Caledonia quartz mill, which bids fair to make them a fortune.

The Caledonia mill is running and paying well. The last week's clean up yielded far better than usual.

Judkins & Kellogg's mill is in full blast and is doing well. The steam hoisting works lately erected at their mine works to a charm. They have their rock hauled from the mine to their mill on sleighs.

The Greenville correspondent writes that Bidwell & Co. are fitting up the old Waterworth mill, near Greenville, and intend working the tailings from the several mills in this vicinity, if, after trying the experiment, they find pay to justify them.

TRINITY COUNTY.

Weaverville *Journal*, Feb. 6th: The flume of Davidson's ditch, across Brown's Creek, was struck by a falling tree on Thursday of last week, and the long span across the bed of the stream knocked out. Five companies who are mining on Union Hill are thrown out of employment until the break is repaired.

During the present winter Mr. McGillivray has extended his ditch about three miles further down the river.

The late storms have set all the Buckeye boys at work, with good prospects ahead.

Mining is being briskly carried on in Weaver basin. Hocking & Co. have already stripped a large piece of bedrock. Their claim was perforated with tunnels, so that by simply turning the water over the bank it would cave without gouging.

Since water came they have been running day and night. Mr. Orson Fox will have his new reservoir repaired in four or five days and will then begin opening his claim in the hill. He found considerable gold in the surface while sluicing out his reservoir, and says there are a thousand acres of surface along the ridge that would pay if cheap water could be had.

Hinds, Dixon & Swift are opening a claim in the banks of Weaver Creek, about 1½ miles above Douglas City, and, it is said, obtain rich prospects. Doliffe & Willey are prospecting a claim on the other side of the creek, nearly opposite Hinds & Co., and are also supposed to have a good thing. Estes & Co. are extending their water race and intend to put in their dam and take the water out some 400 to 500 yards higher up the creek.

We are informed that Hager & Haas have discovered a back channel in the Daey claim of extraordinary richness, and withal extensive. Our informant says that Field & Culver's claim is paying them from $12 to $16 per day to the hand, with four men at work. He also says Lorenz & Jacobs have expended about $4,000 in getting ready their claim on Red Hill, and that they will take out $25,000 or $30,000 this winter.

ARIZONA.

Prescott *Miner*, Jan, 23d: Jos. Young, who returned here from a visit to Black Cañon Creek last week, informs us that when he left the diggings there were six companies sluicing, and many others getting ready for sluicing. He says he does not expect to hear of very many rich strikes being made in Black Canon, but is confident that miners can make from $4 to $10 a day there.

The prospects of the country never appeared better, the Sterling mine is a success, the placer mines of Black Cañon and Lynx Creek are paying well.

We learn that a party of miners from Wickenburg are prospecting the Placeritas, with a view to working them, and another party are preparing to go to work on a quartz ledge. Lamberson & Cullumber are preparing to run arastras by water power, and other farmers were talking of building wheels and arastras.

A private letter from Wickenburg says that business there was good. Kraus, Rees & Co. were running their mill and making the rock pay well. The Vulture Mining Co's 20-stamp mill was also running and paying

A rumor was current in town this week, to the effect that a Pima Indian had found rich gold diggings in the Hacquehila Mountains.

IDAHO.

Silver City *Tidal Wave*, Feb. 2d: The coal mine on Reynolds Creek is still being developed, and its owners are more sanguine than ever that they have it on the hip. The vein continues to concentrate as the tunnel goes in.

Wells, Fargo & Co. shipped from their office in this city, during the month of January, bullion valued at $114,000.

Same, Feb. 5th: Never since the discovery of Owyhee have the mines shown any better or yielded a better class of ore than at present. Cal. Morton showed us a specimen of Golden Chariot, picked up by him a day or two since, that is equal to anything ever seen here since the days of the Poorman discovery in silver, and superior in gold to the best ever hitherto produced in the camp. We do not pretend that the specimen shown us is a sample of the present products of the mines, but frequent observations of the ore from the Ida Elmore, Golden Chariot and Poorman, enable us to say that the quality of the ore is improving on the average of the last years' productions, and that at no time have prospects been brighter for lasting mines and large rewards, always excepting the discovery of the Poorman, where the ledge was found lying flat, and was 90 per cent. silver.

Owyhee *Avalanche*, Jan. 30th: The Rising Star mill at Flint, has stopped temporarily to make some changes in the machinery.

Owing to some misunderstanding between the mill and mine owners, Black's mill has stopped for the present.

NEVADA.

REESE RIVER.

Austin *Reveille*, Feb. 6th: We saw to-day in the cabinet at Boalt & Stetefeldt's assay office a very fine crystal of polybasite, obtained from the Buel North Star mine. It is pronounced to be the finest crystal of that mineral yet produced in this district. The crystal is nearly a steel-gray color, and is large and beautiful.

WHITE PINE.

Austin *Reveille*, Feb. 6th: About 10 o'clock this morning, two teams arrived in this city with machinery for McCone's quartz mill at White Pine; and shortly afterwards came eight other teams from Dayton, hauling machinery for the quartz mill of the Union Co., to be erected in the same district. We learned from the teamsters that there were 22 teams behind hauling machinery for the same mill.

OREGON.

Roubrg *Ensign*, Jan, 30th: Some time since, a letter written by one Foley, from Cow Creek, in this county, was published in the McMinnville *Courier*, in which said Foley claimed that genuine tin ore had been discovered in the vicinity of Cow Creek. It now appears that Foley had a reasonable foundation for the conclusion to which we arrived from an examination of the ore. Mr. William Briggs, of the Cow Creek Mining District, this week gave us a sample of the ore taken from the vein mentioned by Foley, and it certainly answers the description of tin ore in every particular, and it is said that the test to which it has been put convinced those who examined it that it is tin. Mr. Briggs also permitted us to read a letter from Thomas T. Boulin, of San Francisco—who has had a sample of the ore carefully assayed—in which Mr. Bouldin asks for information in relation to the lead, and states that it exhibits enough to warrant the expenditure of money. He further assures Mr. Briggs that, if such ore can be found in sufficient quantity, he is willing to undertake the development of the lead.

UTAH.

Salt Lake *Reporter*, Feb. 2d: We were called upon yesterday by Mr. La Baume, of Premontory City, who reports a lively excitement there over the newly discovered gold diggings, 40 miles west. Mr. La Baume found the placer diggings on the south side of Raft river range to be very rich, yielding 30 cents to the pan on bedrock, with fine gold all the way through the gravel down, of good prospects. It is about five feet to the bed rock. These diggings are about ten miles from the nearest point on the railroad line, and lie along the streams known as Indian creek, Dove creek and Sagebrush creek. The placer diggings lie nearly midway between the Peak and Spring Bay, the most northern point of Salt Lake. The creeks mentioned will furnish enough water for only four or five months in the year, and we are not informed what facilities exist for a better supply, but as the mines are very rich it will probably be found. Clear Creek runs along the northern side of the range, and there are quartz mines in the mountains, though little is yet known of them. Many parties are preparing to "go in" as soon as the snow will allow them to work.

Burying Silver in China and India.—The well known fact of the tendency of these countries, since centuries, to absorb the silver of the world, is accounted for in a degree by the statement of a recent traveler in China that quantities of the metal are habitually buried. He conjectures that since the present rebellion began, the Chinese have buried $500,000,000 worth of coin, most of which is silver and much of which will never be recovered. "It seems just as natural," says Parton, in an article in *Harper's Magazine*, "for the inhabitants of Hindostan to bury a bag of silver in some out of the way corner of a field, as it is for a New York merchant, at half past two P. M. to send round his money and checks to the bank. It is buried in the deepest secrecy. As in France, during the revolution, so in all countries, at times of civil commotion timid people hasten to hide their treasures beyond the reach of the marauder and taxgatherer."

When railroads are built, and foreign enterprise begins to leaven in the great interior of China, the shrewd conservatives of the orient will probably discover that there are better uses to put their hoarded capital to than burying it. They will then cease burying their "talents of silver," and will set it afloat in the world, trusting in the all-sufficient safeguards of commerce and civilization, and China will at once begin to exert an influence, and feel that she is a power, in the world.

Magazine of Travel, Geography and Adventure.—A new English magazine, to be edited by the Assistant Secretary of the Royal Geographical Society, is entitled *Illustrated Travels*. It is to treat of different parts of the world in succession, and is to be a magazine of "travel, geography and adventure."

Engineering.

Destruction of Rich Bottom Lands by River Debris.—An ex-president of the Northern District Agricultural Society dwells upon the wholesale damaging effects of the Yuba, as an example of all our mountain rivers, on the rich adjacent bottoms between the foothills and the valley's drain. He says:

"The river channels are filled up from twenty to thirty feet, or within a few feet of the banks along these bottoms, so that almost every rise of water overflows the land. Upon these lands were our orchards, the most celebrated and extensive in the State, worth from $25,000 to $250,000. These orchards are beginning to die out. A few trees did not bud in the spring, being dead; the remainder came out and bloomed and set the fruit, and then died, so that the peach crop was a failure. Hundreds of acres are entirely dead, and the remaining trees must die the next or succeeding year."

The cost of leveeing, and the difficulty of setting limits to the rivers, are engineering problems which may be solved by many a farmer properly studying his situation, and profiting by the issue of like attempts especially along the American, Bear, and Yuba rivers. The subject is one worthy of attention by engineers, as large tracts not far from the railroad, are held to be nearly worthless, which might be protected by levee systems embracing more than the few isolated farms constituting the usual objects of pretection.

Tunnel Under the Straits of Dover. Of this project, the London *Daily News* of December 25th, says: "It must be remembered that the difficulties to be encountered in tunneling beneath the Straits of Dover are of different character from those which the French engineers have had to meet in tunneling through the Alps. The soil to be traversed in the former instance would probably be the "second chalk formation," which may be assumed to extend in an unbroken course from the place of its uprising in England to the place in which it makes its appearance in France. It need hardly be said that the difficulty in perforating this soil would be very much less than of perforating the hard and complicated material which has been encountered by the French engineers. The workers in the suggested tunnel would be exposed to enormous risks from the effect of the pressure of the sea upon the stratum through which they would have to work. Again and again the water burst into the Thames tunnel and drove the workmen out. And then the workmen in the Thames tunnel had but a comparatively short distance to run when they were threatened with an irruption of water. If such an event threatened workmen engaged nine or ten miles from either outlet of the suggested tunnel, escape would be hopeless. In a short time the whole length of the tunnel would be filled with the waters of the sea, and the labor of years would be rendered useless.

We urge these considerations, however, not as deprecating the suggested attempt. Three eminent engineers, Messrs. Hawkshaw, Brunlees, and Lowe, have pronounced the plan to be feasible; and the estimated cost—nine millions sterling—though large, is still reasonable when the value of the tunnel is considered."

The Snow-sheds. — Railroad men that came down from the mountains recently, speak highly of the efficiency of the snow-sheds along the Central Pacific line, which are said to stand firm while avalanches of snow shoot over them from the hill sides. The damage to the railroad in the Sierras, and the consequent detention of trains which have of late occurred, appear to have been mainly caused by the snow slides. The destruction of the trestle work below Cisco was caused by a snow slide, and it is said another occurred between Truckee and the summit.

Government Surveys in Arizona.—The Government surveys are to be continued in Arizona the present season. R. W. Norris, C. E., late tide land surveyor of this city, has entered into a contract with the Surveyor-General for continuing the surveys on the Gila, and will depart for Arizona in a few days.

The New York Pneumatic Despatch Company have been engaged in tunneling under Broadway for about three weeks. Their progress is not over ten inches daily.

Drowning Out, and Drying Out.—Engineering must come to the aid of agriculturists in preventing these calamities, to which our peculiarities of climate and topography subject so large a proportion of otherwise rich agricultural area. Land is valuable according to its uses. It is the legitimate province of the engineer to know all about the capabilities, and possibilities, of drainage and irrigation, and of opening up lands to a more convenient market. If profits of any kind are more worthy or better deserved than ordinary, it is these which accrue so munificently from "speculations" of this kind, in regard to which capital is always ready to listen and learn.

Proposed Railroad from Limon Bay to to the Gulf of Nicoya.—The Secretary of State of Costa Rica has entered into a contract with Edward Reilly, Alexander Hay, Mutt McCartney and David Viekers, citizens of the United States, for the opening of a railroad across Costa Rica from Limon Bay to the Gulf of Nicoya. The capital is to be $10,000,000; the headquarters of the company to be in New York, Philadelphia, or Boston. The company is to commence its surveys within three months after the ratification of the contract, and within the four following months to spend at least $50,000 in actual work on the road, and the first thirty miles must be finished in complete order from Limon Bay within eighteen months after the signing of the contract.

Irrigation in Los Angeles County.—Mr. Louis Wolfskill is sinking a second artesian well on his ranch, the Santa Anita. He has a flowing well down a little over a hundred feet; and, although his second well runs freely, he intends to sink still deeper to procure a larger supply, and then to make a reservoir to hold the water for distribution at pleasure. This can be done by throwing a line of single embankment across a natural basin, furnishing a large reservoir for irrigating purposes.

Irrigation and Drainage Projects in Tulare Valley. — A Washington correspondent writes: The Committee on Public Lands have not yet reported on the bills for irrigating one portion of California that is too dry, and for draining another part that is too wet (all around about Tulare Lake), but the advocates of these two measures are at work, and believe that *their* bills will be passed.

A Peruvian Railroad.—A letter from Lima says that the government is encouraging a railway projected between Lima and one of the cities at the Peruvian headwaters of the Amazon. Admiral Tucker, it says, has reached in steamers, a point only fifty leagues distant from Lima, through rivers which directly connect with the Amazon, and this road will place Lima in immediate connection with that point.

Alameda Railroad.—The report gains credence,—says the *Alta*,—that the Alameda Railroad will be extended this year to Oakland one way and San José the other, and that work will be commenced upon it this season.

Wrought Iron Water Pipes.—The President of the Spring Valley Water Company is indignant at the imputations cast upon the stability of his water pipes. They didn't burst—only a landslide destroyed the connection.

A steam tramway from Hamilton to Treasure City is contemplated.

Borax for Washing.—Refined borax, it is reported, is used by the women of Holland and Belgium as washing powder instead of soda. The proportion of a large handful of borax powder to about ten gallons of boiling water, it is asserted, makes the linen beautifully white and saves half the expense of soap.

Inoculation for Hydrophobia.—A physician at Bordeaux, France, thinks he has discovered a plan for the prevention of hydrophobia by inoculating men and brutes with the poison of a viper feared in the south of France, but whose bite is not fatal.

Mythology tells us that Io died because of her intense love for Jupiter; but the charm of the romantic story has lately been destroyed by a chemist discovering Iodide of potassium.

Tennessee Mineral Lands.—Captain Moses W. Nelson's mineral lands in Carter and Johnson counties, Tenn., have been purchased by English capitalists for $10,000,000.

San Francisco:

Saturday Morning, Feb. 20, 1869.

Notices to Correspondents.

ONE INTERESTED.—The age of victims of small pox in this vicinity, is stated to have been as follows: Under 1 year, 38; from 1 to 2 years, 29; 2 to 5 years, 63; 5 to 10 years, 46; 10 to 15 years, 20; 15 to 20 years, 27, 20 to 30 years, 126; 30 to 40 years, 88; 40 to 50 years, 44; 50 to 60 years, 18; 60 to 70 years, 5; unknown 1—total, 505. This statement would have been instructive had the ages been specified according to the places of nativity; for instance, the whole number of victims whose country was England and Wales, only amounts to seven, yet from the British American provinces they enumerate 13, and from Australia 7; or the two nearly three times the number of victims from England and Wales; while the number of our citizens who are natives of the last named, far outnumber those from the two first. The cause of the difference is easily accounted for, viz: infantile vaccination has been general for many years in England, and not so in the provinces and colonies.

J. H. R., West Point, Calaveras County.—You are in the Sacramento mineral district, and the U. S. Surveyor for the same is S. M. Wilson. We have published a pamphlet containing the National Mineral Land Law, and blank forms, five in number, to be used in obtaining a patent. Price of pamphlet 25 cents; blanks 12½ cents each, or $1 per dozen. As to the length of crank on a windlass with which a man 5 feet 10 inches tall can work to the best advantage, the question, though simple enough, is one calling for a good deal of theoretical, as well as practical knowledge of the subject, and in regard to which "experts" would be very likely to disagree.

PYROMETER.—The capacity of bodies for heat is materially effected by their density. Whenever density is diminished, capacity for heat is increased, and *vice versa*. For instance in solids, if we suddenly compress a piece of metal, it becomes hot, because its capacity for heat is diminished; consequently, in its compressed or denser condition, it contains less heat than it did prior to compression. A bar of red hot iron when subjected to great pressure, as when passed through a powerful rolling mill, becomes nearly of a white heat.

MECHANIC.—The weight of No. 10 plate iron, Birmingham wire guage, is given on Wm. Johnson's wall chart of the "Properties of Metals chiefly used in the Arts" as 5.5 per square foot. Being a reference chart for iron dealers, this is probably more to be depended upon than your several Mechanics' Companions.

WHISKY.—Alcohol is six times more expansive by heat than mercury, and water only about twice as much. Pure alcohol will measure, in the hottest part of summer, about five per cent. more than in the depth of winter.

Overcoming Difficulties in Amalgamation.

The working of the Rising Star silver ores, in Flint District, Idaho, by roasting and amalgamating in pans, has encountered very great difficulties, by reason of a considerable quantity of iron which, in company with copper and silver, amalgamates very readily, but on being melted after retorting, separates in the form of infusible lumps, and must be removed from the surface of the liquid metal before the bar can be cast. This iron not only causes an imperfect extraction of silver from the ore, but it combines also, in different proportions, with the precious metals in the crucible, as stated, and is, on the whole, so injurious that a continuation of operations with such results is found quite inadmissible.

The ore consists of rich argentiferous gray copper ore (fahlerz), miargyrite, some ruby silver, zinc blende, iron pyrites, some galena, and sulphuret of antimony. The fahlerz also contains lead. After long and fruitless experiments to render this iron "amalgamatable," Mr. Kustel, the metallurgist, was engaged to introduce his leaching process, the application of which, as we are informed, has resulted in a most flattering success.

The roasting was suitably modified, and six leaching boxes (seven feet by six and a half each, and eighteen inches deep) constructed, large enough to receive one ton of roasted ore, as a charge, to each box. The leaching with hot water requires three hours, and about two hours more are required for draining, before the ore is removed into the amalgamating pans. The greater part of the base metal ores being carried out during this leaching, the iron is, of course, entirely prevented from entering the amalgam. By the aid of this process the silver is now extracted to 88 per cent. of the fire assay; with a saving besides of four-fifths of the quicksilver lost prior to leaching.

The formation of this iron amalgam is a very strange, and inexplicable circumstance in pan amalgamation. It is not formed, says Mr. Kustel, in consequence of the action of the chloride of copper on the metallic iron ground off from shoes and dies; and does not occur where a great quantity of iron pyrites is in the ore provided that other base metals are not to a considerable extent present at the same time.

Where it occurs, it forms, after retorting, a black, spongy metal, like magnetic iron, and melts from this state easily into solid lumps of iron; but after arriving at that stage, it is impossible to fuse these lumps over again, even at the intensest white heat.

The Rising Star mill is said to be a magnificent building, provided with the best machinery and excellently arranged. There are thirty stamps, crushing dry. From these the ore is at once conveyed by means of endless screws and elevators to three of O'Hara & Thompson's self-discharging roasting furnaces. These have each an 80-foot long roasting-hearth, with a 6-foot feeding, and 18-foot cooling-hearth. The ore introduced into them is taken by two shovels or plows fastened on an endless chain, and carried through the hearth, which is heated by three fire-places, and discharged in from five to six hours; the discharge being continuous, at the same rate as the stamping and feeding. Only two men attend the roasting of the three furnaces.

Of the silver contained in the Rising Star ore, 94.8 per cent. is turned into chloride of silver. It is found somewhat difficult to manage properly the base metals, without interfering with the proper percentage of chloride of silver; and there are other difficulties connected with these furnaces, which, however, are not deemed at all insurmountable. At the end of the furnaces are the leaching boxes, whence the ore is transported to the pans. These ought to be placed near the leaching tubs. The settlers used at the Rising Star mill are Belden's, discharging the pulp through Hungerford's concentrators, by which means a good deal of quicksilver and amalgam is saved.

Parting of Gold and Silver.

This is what is usually understood by "refining"—a simple and inexpensive process, consisting in a mere boiling of the bullion in nitric or sulphuric acid, by which means the silver is dissolved, drawn off separately, and precipitated, while the gold remains behind in the shape of a brown powder looking very much like mud. Little space, and scarcely any outlay, are required for apparatus; and the principal skill necessary is in working carefully, so as to prevent small leakages and wastage. Where gold is handled in the shape of mud, and silver in tubs of cement resembling slaked lime—the condition it is in after being precipitated from its solution—another not unimportant quality in the refiners, as determining the cost of refining, is a scrupulous honesty; as the most trifling waste, where hundreds of millions' worth of bullion are separated, would not require a long continuance to amount to a million or two of unperceived loss at the expense of the miner as a matter of course.

We learn from Washington that an old scheme, aiming to engineer into private hands the parting now done, with perfect facility and economy, in the mints, is before Congress in the shape of a bill introduced by Senator Stewart of Nevada, and vigorously pressed by the representatives of the leading assaying and at present the only active refining establishment in this city—having, by a judicious and unstinted use of capital, and by large capitalist connections, together with some legislative manipulation at Washington, now nearly succeeded in driving all competition in assaying and refining out of the field.

The question is, therefore, whether the Superintendent of the Mint shall be authorized to exercise such discretion as he may see fit, in receiving from the firm in question, "deposits of refined bullion suitable for coinage, and paying the depositors thereof in unparted bars."

Were this bill to become a law, it seems all but certain that, instead of having our bullion parted at fair rates, the price for doing such work would hereafter be at the bidding of a monopoly. As all our gold bullion contains silver, and nearly all our silver bullion contains gold, the privilege of fixing tolls upon the products of the miner, which must of necessity pass through the refiner's hands, is evidently no mean prize to be coveted—a result certainly justifying the most patient, laborious and powerful exertion, from year to year, of the most skillful managers that can be put forward with such a scheme, by the parties interested, as a business enterprise alone.

The rate of exchange is left to the discretion and honesty of the Superintendent of the Mint. But that discretion is, under the manipulation of this bill, of such a character that a little negligence or nominal stupidity on the part of that public officer, may compel every miner of the Pacific coast to put aside his tribute to a private assaying firm; and when probity, and easy-going good nature, not to mention stupidity, are the worst offence necessary to be committed under so happily conceived a bill for the purposes in view, it is possible for even a tolerably honest Superintendent of the Mint to succumb to the temptation, for example, of permitting a friend to become interested in the prosperous refining company in question; while the differences would be so small, that the bullion-producing public would never find it out.

This project is admirably planned, and very plausibly put forward. But what are the evils that call for a discontinuance of refining in the Mint? "It is not shown with any clearness," says the *Bulletin*, "that if the whole business of refining were placed in the hands of private parties, it would be done any better or any cheaper; but it is rather made to appear that the business is profitable enough to be coveted by private parties, and that its exclusion from the operations of the Mint would lay heavier burdens upon the Government for the support of that institution."

We are informed by a late Washington correspondent that, "as the bill has been somewhat modified in its principal features from the shape in which it was presented last session, it will probably be passed."

First let it be shown that the interests of the public are the moving cause, and it will be easy to determine whether any modification of the measure is likely to be an improvement, such as will justify our representatives in lending countenance to it, or in permitting themselves to be led into any "entangling alliances" thereby. We have heard of no miners—*bona fide* bullion producers—petitioning for the proposed change.

SCHOOLS FOR INDUSTRIAL SCIENCE.—A marked feature in the advance of modern educational institutions is the facilities afforded for the acquisition of the practical arts and trades; not by mere rote, as is usual with mechanics, but with due attention to the interesting principles applying in every case, the understanding of which makes the true mechanic, useful in his place because his soul is in his work. Except in "running a quartz mill," or the like fancy pursuits, the utility of a thorough knowledge of the theory applying, as well as of the practice, in money-making industrial pursuits, is not often questioned, or at least is not held to be an absolute disqualification. One of the largest schools of applied science in the world is the *Ecole Central des Arts et Manufactures*, in Paris. It has 500 pupils. Amongst 2,000 young men who have left this school, the career of 1,394 has been recently traced, and the issue was this: 247 had died, while of the others 480 were engineers or superior officers of railroads; 54 were mechanical engineers; 124 were iron masters; 280 manufacturers of considerable eminence; 55 architects; 35 contractors for public works; 42 professors of the applied sciences. The rest filled honorable posts in trade or in the service of the French or foreign governments.

In addition to some very valuable institutions of the kind that have grown up in this country, it is stated in the Memphis *Appeal* that Gen. R. E. Lee has now in operation at Washington College, Virginia, a practical department for the benefit of young men who wish to become master workmen as carpenters, machinists, etc., in which students are instructed in the principles of mathematics required, and in the use of the tools.

THE HAFENEGGER POWDER EXPERIMENTS, at Fort Point, Friday, were quite successful. One massive, hard rock, 38 feet in length, by 20 in bight and breadth, irregular, (estimated to contain 16,000 tons) was broken through and through, about two-thirds being thrown off. This was done with three pounds of the strongest powder in a 1¾-inch hole sunk to the depth of ten feet. The cartridge was only 1¾ inch diameter, and no tamping was used in the charge. We believe there is no record of such an exhibition of power from so small amount of any powder heretofore in use. For want of time we shall give particulars next week.

THE GREAT BOILER from McAfee & Spier's works, which has been seen engineering its way, very slowly but surely, through the streets towards the city front, reached the Sacramento steamer wharf a number of days ago.

Wanted, a Wind and Rain Map of the Coast.

Observing old residents in particular sections are generally well enough informed about the winds and rains, during a portion of the year at least, in the localities in question, to answer for every practical question touching their own individual interests, or others with which circumstances have made them accidentally familiar. But new comers, who are frequently the enterprising persons that are most likely to conceive of new developments, as well as to judge wisely of their chances of success, are in too many cases brought to a standstill by a want of easily accessible data indicative of the climate of particular localities, such as would be presented in a wind and rain map—and the possession of which would immediately transform a matter of unbusiness-like venture, arising from uncertainty as to the climatic conditions, into one of certainty, and consequent likelihood of being carried out.

Not merely agriculture, and the productions of the soil, are affected by these conditions,—constituting a law of probabilities, without a knowledge of which no shrewd business man will take his first step,—but all the manufacturing and commercial interests which follow in the wake of agriculture, are interested in knowing and comprehending the nature and the probabilities of failure in the several fundamental producing pursuits. Especially is this the case in a country so widely differing in its local climatic conditions as are the varied situations, between mountains and valleys, of the Pacific Coast.

All that is needed is the distribution of a lot of rain gauges,—which cost a mere trifle,—and some blank sheets of ruled, or "engineer's paper," to record the observations in graphic form, or in such a manner as to present correct weekly and monthly averages for all the more important points on the coast. A publication of the results, shown comparatively, would be of the greatest pratical value.

It is suggested that the next Legislature would do well to appropriate a small sum for the maintenance of rain gauges, in connection with the State Agricultural Society, or the Academy of Sciences. The reports of a single year would undoubtedly do more good than "horse racing upon the grandest scale."

By reference to the proceedings of the Academy of Sciences, in another column, it will be seen that action is proposed to be taken on the subject by that body.

Our Next Industrial Exhibition, under the auspices of the Mechanics' Institute of this city, will open about Sept. 1st, 1869, and will probably be even a greater success than the last. Circulars have already been sent to China, and will be sent without delay to Australia, and down the western coast countries, giving notice of definite arrangements, and inviting exhibitors. In the circular to China, Mr. Hallidie, the President of the Mechanics' Institute, says:

The railroad across the coutinent connecting us with the eastern shores of our country will be completed in April next, and we will then be brought in communication with the more thickly-populated and older portion of our own and surrounding counties; by this means facilitating the intercourse of nearly 80,000,000 people. San Francisco, by its position, will be the entrepot of the Chinese trade, and a center for exchanges. In view of this, it is believed that the forthcoming Industrial Exhibition will be of material interest to the people of China; and it is suggested that means be adopted by them to be represented here at the Industrial Exhibition at that time. Arrangements will be made with the Pacific Mail Steamship Company for the free transportation of goods intended for exhibition.

A Mastodon at Petaluma.—It is reported that the skeleton of a mastodon was being exhumed near Petaluma last Thursday.

Gas Purification—Lime or Iron.—We have received from the editors of the *American Gas Light Journal*, the report of Prof. Henry Wurtz to the Manhattan Gas Company of New York, upon the comparative merits of the Lime and Iron methods of Gas Purification. The two large gas companies of that city, the New York and Manhattan, respectively employ, the first the "Iron Process," and the last the "Lime Process." It is a very important sanitary question, which of these two has the effect to vitiate in the greatest degree the air of a populous city. Prof. Wurtz found that the odor of sulphuretcd hydrogen, and other persistent stenches familiar to the people of New York, were oppressively perceptible *at some distance* from the "purifying house" of the company using the iron process,—where the fouled iron oxide was spread out for fermentation;—although, *in the immediate vicinity*, they were masked by the more powerful odors,—we may say perfumes,—of ammonia and naphthaline. In the Lime process, on the other hand, as employed by the other company, where the effete lime is revitilated or "revivified" in a supplementary purifier charged with hydrate of lime, the only perceptible odor under the same circumstances is that of *phenol*, or carbolic acid; which is perhaps rather an advantage than otherwise, it being a powerful and valuable disinfectant.

Prof. Wurtz names the various ingredients of the gas which call for removal,—either on account of their effect upon the health of the population, or upon the illuminating value of the gas,—and remarks upon the chemical relations of the most important of them to each of the two processes. He concludes that the tendency of progress is in the direction of a return to the use of lime for gas purification; that the only thing which led to the adoption of the iron process, was the difficulty of getting rid of the fouled lime,—while the iron oxide could be used over and over again; but that the improved mode of deodorizing the lime now places the advantago largely upon the other side.

Quarterly and Monthly Editions.

At the end of each quarter a large number of our weekly issues for the preceding three months are bound up in book form, which, by special arrangement, are placed upon the ferry boats and various steamers leaving San Francisco and other ports on the Pacific Coast, for free reading by the intelligent traveling public. The Quarterlies are also to be found in the principal libraries, depots, hotels, and free reading rooms of the Coast.

This, in addition to our Monthly Series and large weekly circulation, makes the Press the best and cheapest general advertising medium throughout the Pacific Coast. The value of advertising in our columns, however, is best determined by those who have tried it, and we respectfully refer to our patrons in that line. No paper in the United States can boast a better class, and no weekly paper on the Pacific Coast receives as large a sum for regular advertising, or has more constant or long-continued customers.

414 CLAY, DEWEY & CO. S. F., CAL.

Mining & Scientific Press

U. S. AND FOREIGN

PATENT AGENTS.

Circulars and Advice Free.

Messrs. Dewey & Co., Publishers of the MINING AND SCIENTIFIC PRESS, the only well-established successful Patent Agents west of the Rocky Mountains, give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

DEWEY & CO.,

Patent Agents, Publishers and Printers, 414 Clay street below Sansome, San Francisco.

A. T. DEWEY. W. B. EWER.

Postmasters are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v18-aim

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16f

ACROSTIC.

Pain Killer is *worth* what it weighs, in gold,
All around the world are its praises told;
It will Cholera cure—scourge of southern climes,
No victim dies, who takes it betimes.

Keep Pain Killer—a true friend by your side,
It will cure Cough or Cold, or Colic beside;
Look out to apply it for Bruise or for Sprain,
Let it once be tried—"*twill be used again*;
Every word I am telling you, Reader, is true;
Remember that Pain Killer is *good for you*.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.
REDINGTON & CO., and HOSTETTER & SMITH, San Francisco Cal., General Wholesale Agents. feb1m

CHANGE.

C. C. HASTINGS & CO.

Wholesale and Retail!

SUPERIOR GOODS! REDUCED RATES!

C. C. HASTINGS & CO.,
SUCCESSORS TO
Heuston, Hastings & Co.,
SAN FRANCISCO AND NEW YORK,

Announce to the friends of the old firm, and the public at large, that their present business arrangements are such that they are enabled to offer the best and most stylish goods on the Pacific Coast at a great reduction from former prices.

AT WHOLESALE.

The attention of the merchants throughout the Pacific Coast, is called to the fact that we are now prepared to fill their orders for superior goods in

Strictly Custom-Made Clothing,
Suits, Gloves, Hosiery, and
Furnishing Goods, Trunks,
Traveling Bags and Valises,

In lots to suit at regular wholesale rates.

CLOTHING TO ORDER,

Made either in New York or San Francisco, under the supervision of the best cutters in America.

DIRECTIONS FOR MEASUREMENT

Sent to any address upon application, and goods forwarded by Express on receipt of orders. Satisfaction guaranteed.

C. C. HASTINGS & CO.,
Successors to
HEUSTON, HASTINGS & CO.,
The Fashionable Clothiers,
New York and San Francisco.

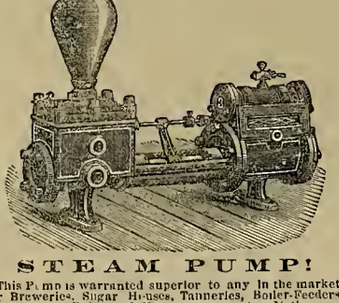
BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

W. O. M. BERRY & CO'S,
Agents for Pacific States,
8v18 3m 114 California street, San Francisco.

Our Office.

The office of the Mining and Scientific Press is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

DEWEY & CO.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

Returned.—Dr. J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M. Taylor, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

Where to Advertise.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

PACIFIC
Rolling Mill Company,
SAN FRANCISCO, CAL.

Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.

☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.
☞ The highest price paid for Scrap Iron. 9v14-3m9p

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods.
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pou rings.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
1v18-3m9p 519 Front street, San Francisco

$20,000 to $25,000.

A PRACTICAL SMELTER wishes to enlist capital to build a Furnace on a Mine of rich Argentiferous Galena at White Pine. From $500 to $1,000 a day can be cleared with ease. Security and best of references, etc., given.

Address, WM. F. HILTON,
7v18-1m9p San Francisco P. O.

INDIA FLEA DRUG!

A California Discovery.

This is a simple but very efficient FLEA POWDER.

It is Death to Fleas and Vermin, but not Injurious to persons.

TRY IT! TRY IT!! TRY IT!!!
After a thorough test you will use none other.

PUT UP IN BOXES ONLY. FOUR SIZES.

It is the best and cheapest article of the kind ever offered to the public.

Directions for Use.—Sprinkle your bedding and clothes, and add a little in your washing.

For sale, wholesale and retail, by Druggists.

☞ For further information, address
Prof. C. E. JAYCOX,
Care of Langley & Crowell, Druggists,

MACHINERY AGENCY.

W. O. M. BERRY & CO.,
Are the manufacturers' agents for Richardson, Merriam & Co's celebrated
WOOD WORKING MACHINERY,
Embracing every description of Planers, Matchers and Mortisers, Moulding, Tenoning, Boring, Shaping, Vertical and Circular Re-sawing Machines; Scroll, Railway, Cut off and Rip Saws, etc., etc. Agents for the Swam cot Co's
Improved Portable Engines,
Warranted fully equal to any in the market; Davis & Furber's Woolen Machinery; Blake's Patent Steam Pumps; Kilburn's and Warren's Turbine Water wheels etc., etc.

Orders for Machinery of any kind will receive prompt attention. Machines for special purposes made to order. Send for Illustrated Catalogue. W. O. M. BERRY & CO.,
8v18-3m 114 California st., San Francisco.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. F. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1854, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Mining and Scientific Press.

Orders from the interior faithfully attended to.

AMBERGRIS.—This valuable substance is found in the intestines of diseased sperm whales. N. E. Atwood, of Provincetown, Mass., writes thus to the *American Naturalist:*

"In 1862, the schooner Estella, of this port, killed a lean sperm whale, from which they took sixty-six pounds of ambergris, which, on the arrival of the vessel, sold for $64 per pound. On another voyage, in the following year, the same schooner captured a whale, from which they took twenty-three pounds nine ounces, which sold for $70 per pound. Last spring a very lean whale was killed by the schooner Watchman in the West Indian seas, from which was taken thirty-eight pounds fifteen ounces of ambergris, which sold for $90 per pound, amounting to $3,504.37. These cases are all that I have found where whalers have been fortunate enough to find ambergris in whales. There is no doubt that they sometimes let carcasses go that contain more value in the intestines than the whole blubber is worth. This substance, accumulating in the intestines, causes a stoppage so that nothing can pass from them; in this condition they cannot live long."

NEW OPERATIONS AT THE BANNER MINE. We are allowed to copy the following from a private letter written by one of the owners of this mine:
